

APPLICATIONS OF CONTINUOUS MONITORING WITH INTELLIGENT ANALYTICS

For Fugitive Emissions Monitoring in the Australian Oil & Gas Sector

Michelle Liu and Dennis Prince

APGA 2022 Conference and Exhibition
September 24 – 27, 2022 | Brisbane, Australia

THIS PRESENTATION WILL:

- Discuss the challenges with measuring fugitive emissions
- Compare emerging monitoring technologies with traditional approaches
- Present the capabilities of continuous monitoring with intelligent analytics

EMISSIONS MONITORING - WHY?

- Protect the environment and communities
- Make site improvements
- Effectively use existing resources
- Decrease potential product loss
- Increase site safety
- Control the narrative

NATURE OF EMISSIONS

Fugitive emissions are challenging to measure due to their intermittent and uncertain nature.

The challenge	What is needed
Emissions can occur in unsuspected locations	Large spatial coverage
Emissions rates vary over time	Frequent monitoring
Confirmation bias	Undirected (unbiased) monitoring

TRADITIONAL APPROACH

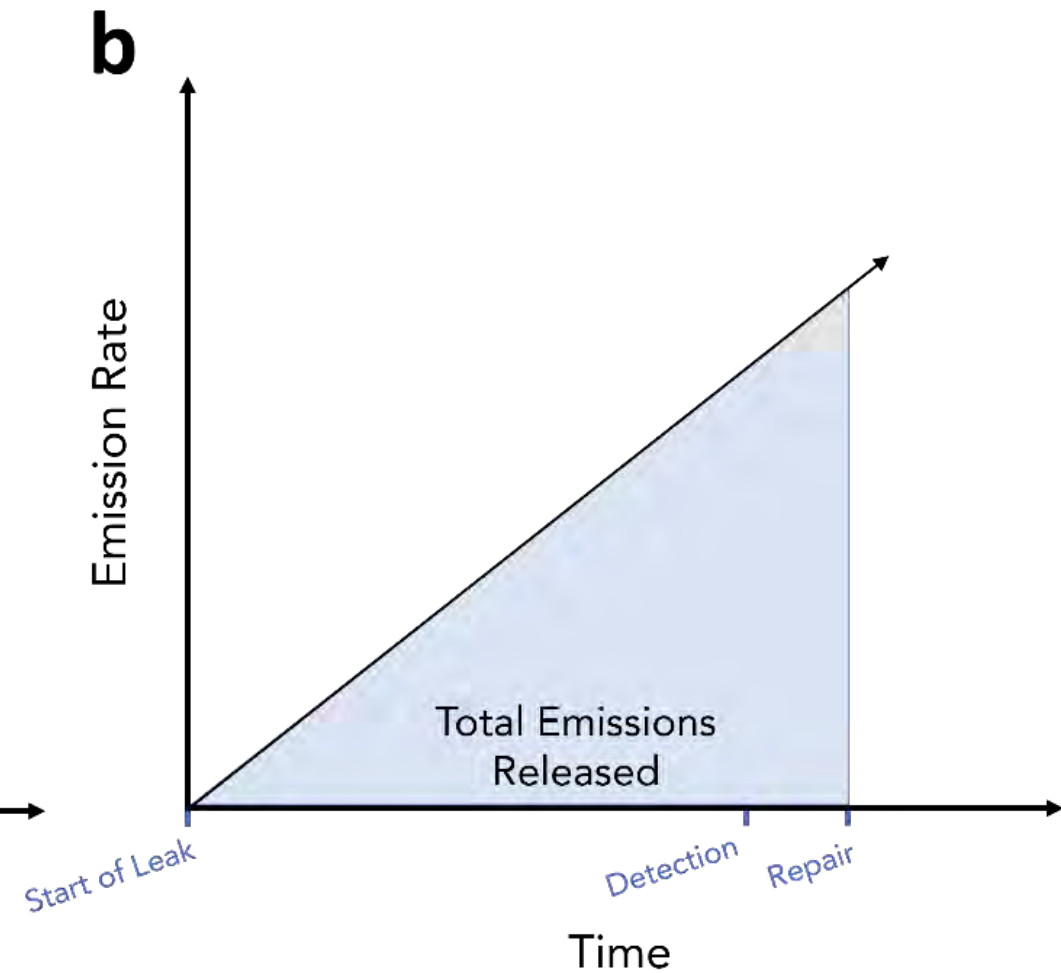

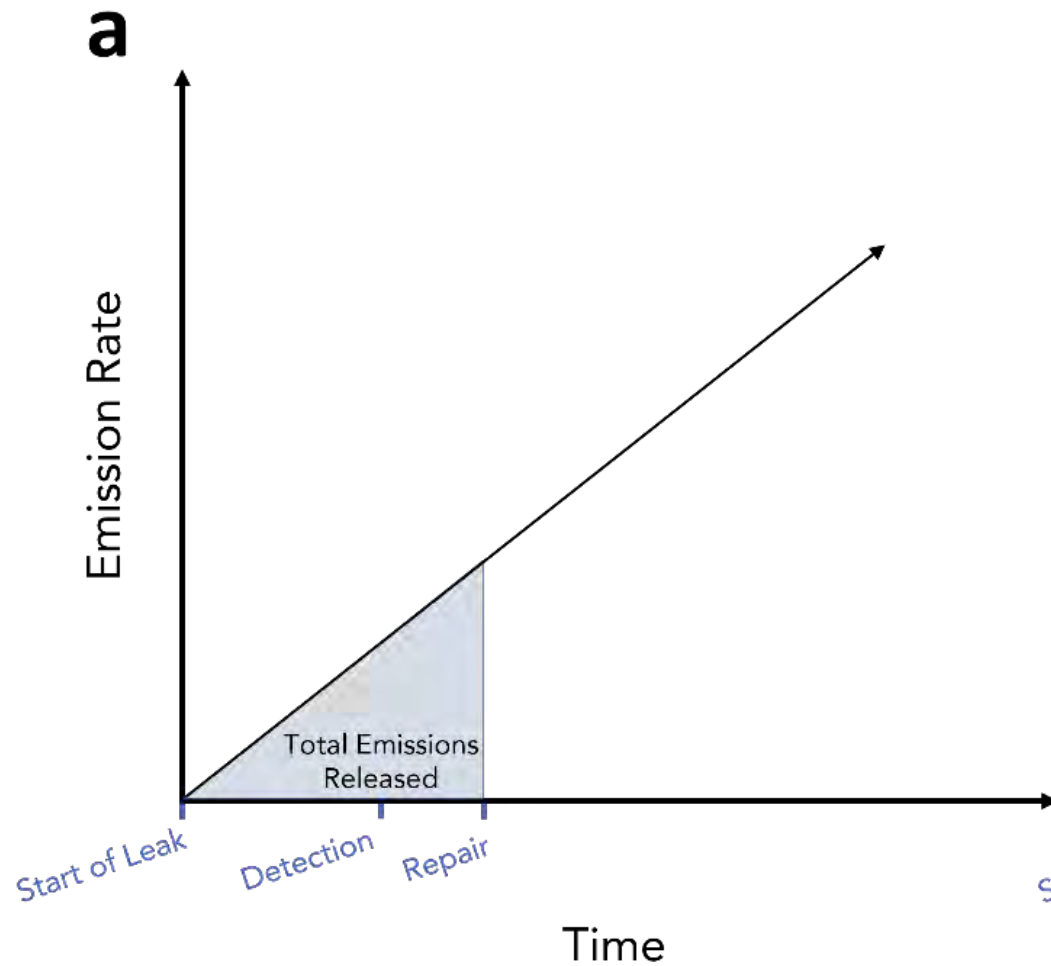

Method 21 (Handheld Instruments)

- Performed a few times a year
- Labor intensive and slow
- Can't detect unexpected sources

OGI Cameras

- Perform surveys more quickly
- Able to detect unexpected sources

TRADITIONAL APPROACH

ADVANCED TECHNOLOGIES

Vehicles

Satellites

Aircraft

Drones

- Easily monitor large geographical areas
- Less confirmation bias
- Periodic frequency

AIRDAR: AIR DETECTION AND RANGING

AIRDAR: AIR DETECTION AND RANGING

Sonar

Radar

HOW IT WORKS

The nose: standard detectors

Measure concentrations

- Traditional monitors
- New sensors

The brain: data analytics

Tracks plumes back to their sources and quantify emissions

HOW IT WORKS

1. Visualizes a plume in data
2. Finds the direction to the source
3. Triangulates from multiple sampling points
4. Quantifies emissions

ADVANTAGES

- Constantly monitor all emission sources
 - On-site and off-site coverage
- Operate without needing a technician on-site
- Monitor any compound
- Enables cost savings

✓ Possible
 △ Sometimes possible

Feature	Continuous	Vehicle	Satellites	Aircraft	UAV	Handheld
Detect suspected sources	✓	✓	✓	✓	✓	✓
Detect unsuspected sources	✓	✓	✓	✓	✓	△
Point source quantification	✓	✓		✓	✓	△
Site quantification	✓	△	✓	△	△	
Continuous monitoring	✓					
Site-wide surveillance	✓	✓	✓	✓	✓	
Detect off-site sources	✓	✓	✓	✓	✓	
Affected by poor weather	✓	△				
No operator safety concerns	✓		✓		✓	

KEYERA GAS PLANT

4% Air
96% THC

Offsite rogue source located

76 L/min THC

Tank emissions reduced 50%

993 L/min THC

Onsite rogue source located
worth \$520,000/yr
31 KT/yr CO₂E GHG equivalent

3967 L/min THC

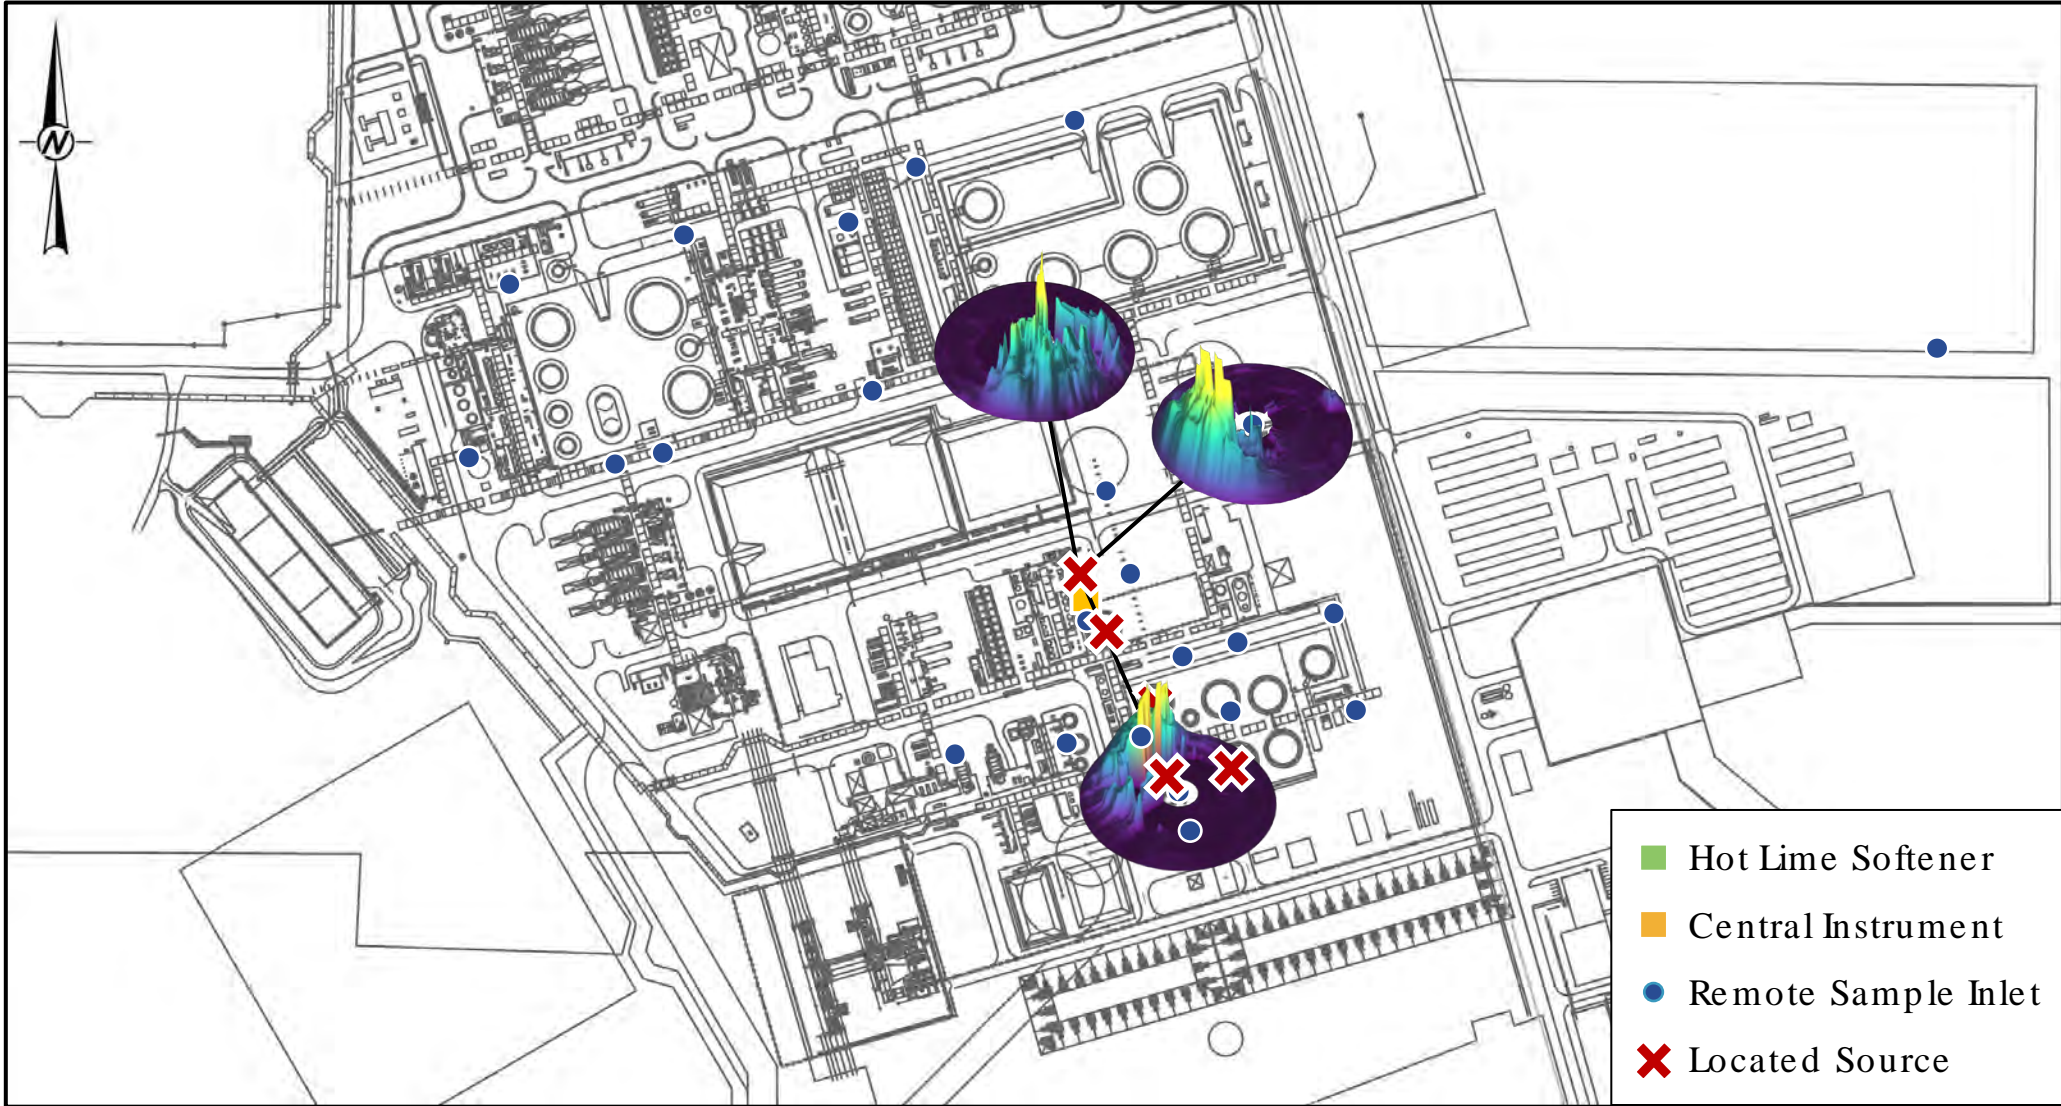

SAGD FACILITY

BACKGROUND

- Facility was experiencing high levels of H₂S
- Known emission sources present
 - Hot Lime Softener (HLS)
 - Tanks
 - Relative importance unknown
- Implemented continuous monitoring of H₂S and methane (THC)

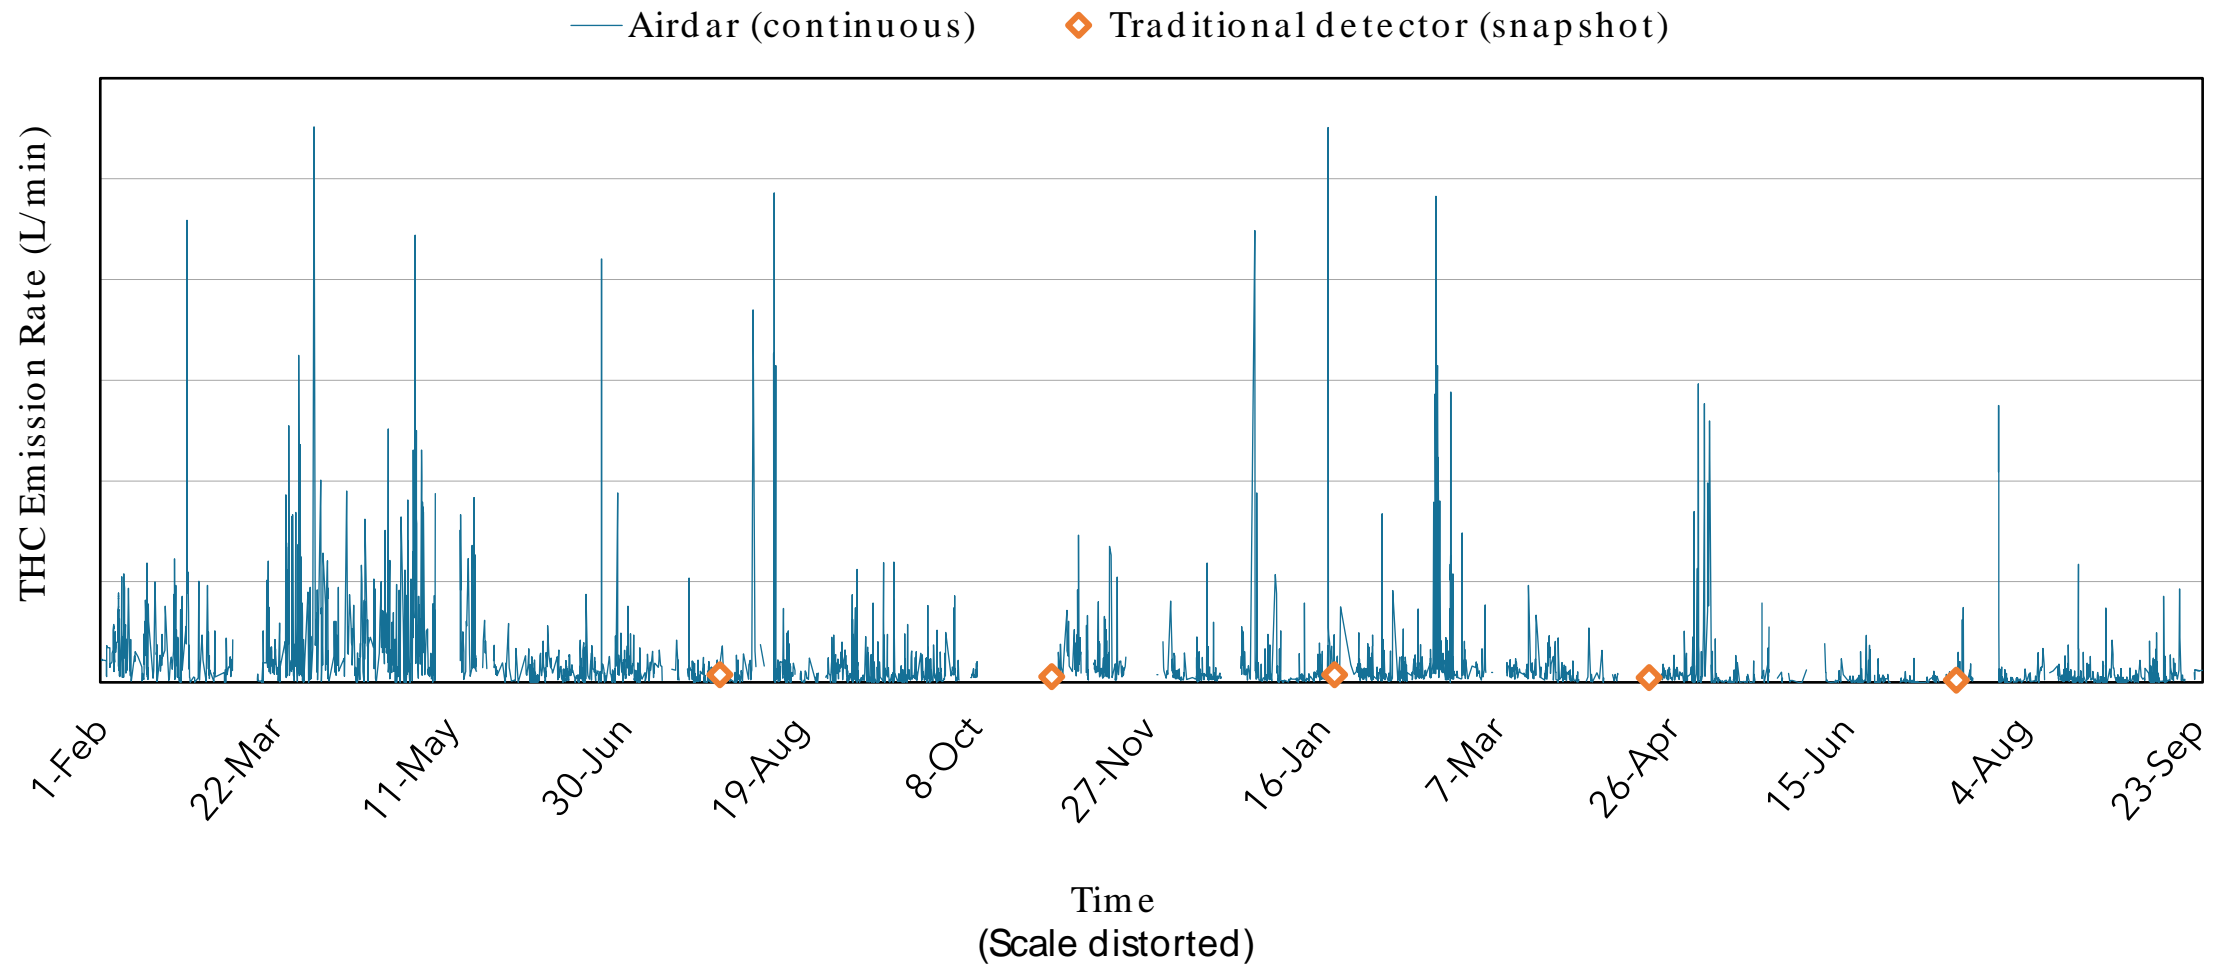

- Hot Lime Softener
- Central Instrument
- Remote Sample Inlet
- ✕ Located Source

Site intervention – visible emission reductions

Green – HLS | Yellow – Tanks | Light blue – Tank farm (area 2) | Orange – Tank farm (area 1)

CONTINUOUS MONITORING

Applications in Australia

- Remote operations are challenging to monitor
- Opportunities at small and large sites
 - Gas fields
 - Compressor stations
 - Pipeline networks
- Learn from experiences in North America

SUMMARY

- Continuous monitoring overcomes challenges in monitoring fugitive emissions
 - Catch leaks sooner
 - Capture variability in emissions
 - Direct resources to the most important issues
- Emissions can be directly measured
 - Can use concentrations to locate and quantify leaks
