BRT Station Design

Optimizing BRT Design
using a Macroscopic
Spatial Parameters (SP)
Model

Presentation Content

- Reasoning (or objective) why the model was put together in the first place
- some definitions and assessment techniques (built into the model)
- some model examples / applications
- Finishing off with some conclusions and recommendations

Thinking and Acting – For Our Clients

Towards Appropriate BRT Station Design from a Pedestrian Spatial Utility Perspective

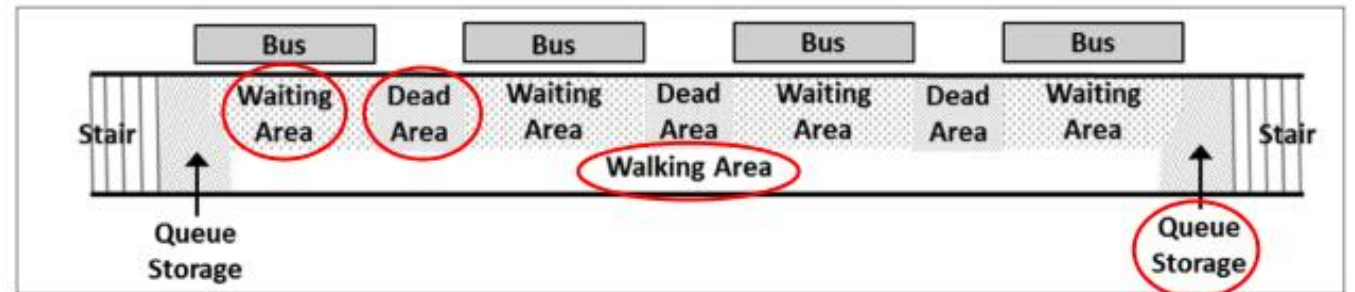

Annual National Conference - Adelaide, 12 – 15 August 2014
Laurent Hermant

*Microsimulation techniques
(Demand Side Assessment only)*

Problem Statement

1. Microsimulation requires **considerable detail**.
2. During the Phase 2 BRT conceptual design, there **was a need to evaluate station design typology faster** as operational criteria changed continuously....
3. This led to the **development of a macroscopic model** specifically developed to assess BRT station typologies from
4. both a demand side (pax) and supply side(bus schedule).

BRT Definition

Assessment Components

- Alighting / boarding bus (multiple doors); *or can the pax be accommodated by the bus frequency – ie not left stranded*
- Walking onto or off the platform / waiting on platform; *density LOS on platform*
- Passing through the fare gates / turnstiles;
- Walking on the sidewalk outside the station;
- Evacuation (Emergency) scenario (**NFPA 130**) – *Evac compliancy ?*

Assessment Definitions: Level-of-Service (LOS)

| LOS | Platform corridor Flow (pax/m/min) | Platform Queuing Area Density (m ² /pax) | Platform Walking Area Density (m ² /pax) |
|-----|--|--|--|
| A | < 23 | > 1.2 | > 3.3 |
| B | 23 – 33 | 0.9 – 1.2 | 2.3 – 3.3 |
| C | 33 – 49 | 0.7 – 0.9 | 1.4 – 2.3 |
| D | 49 – 66 | 0.3 – 0.7 | 0.9 -1.4 |
| E | 66 – 82 | 0.2 – 0.3 | 0.5 - 0.9 |
| F | > 82 | < 0.2 | < 0.5 |

defined by the **TCQSM** (Transit Capacity and Quality of Service Manual) (as published by the TRB)

Model Fundamentals

- Basic Excel spreadsheet model
- Tests Demand and Supply Side Metrics (of BRT Station Elements)
- Tests Evacuation Compliancy
- Multiple Station Typologies

Kerbside Stop

Closed RAM Station

Major Elements of a BRT Station

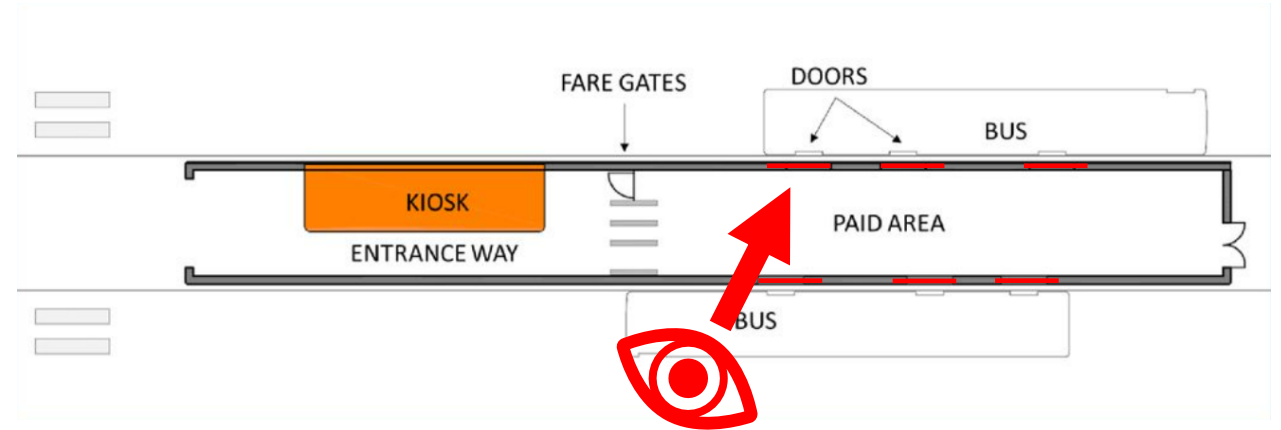

Elements of a BRT Station: Corridor

Input Variable: *Width*
Output Metric: *Pax/m/min (Flow)*

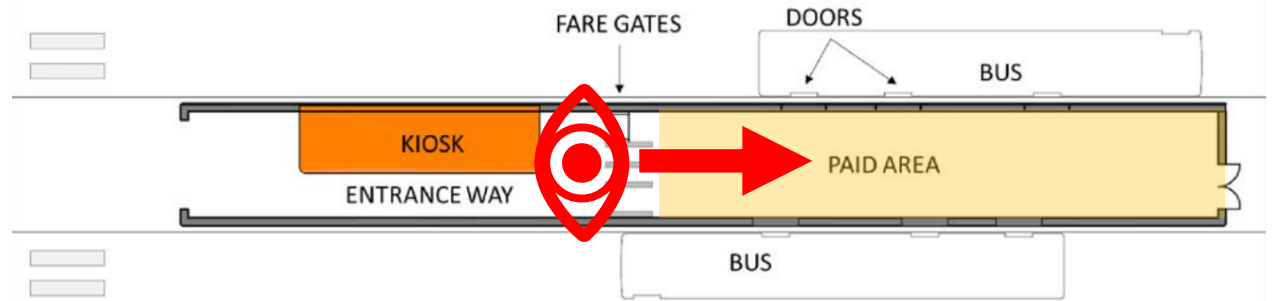

Elements of a BRT Station: *Bus doors*

Input Variable: *no. Doors, Door open/ close time, B&A Rates*

Input Metric: *sec/pax*

Elements of a BRT Station: *Paid Area*

Input Variable: *Area*

Output Metric: *Density (m²/pax)*

Elements of a BRT Station: *Fare Gates*

Variable: no. *Fare Gates* & *Service Flow Rate*

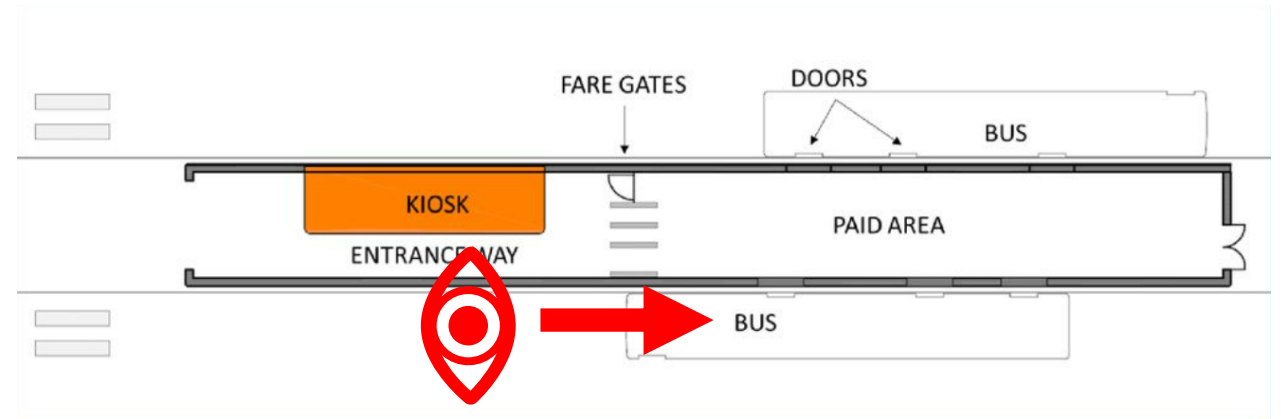

Input Metric: *Pax/min/gate*
Output Metric: *q/c ratio*

Elements of a BRT Station: *Run-off Length*

Input Variable: *Length*
Output Metric: *Confined q/c*

Elements of a BRT Station: *Bus*

Variable: no. Doors, Door open /close time, Ramp Deployment time, Frequency / Headway

Citaro (628.283)

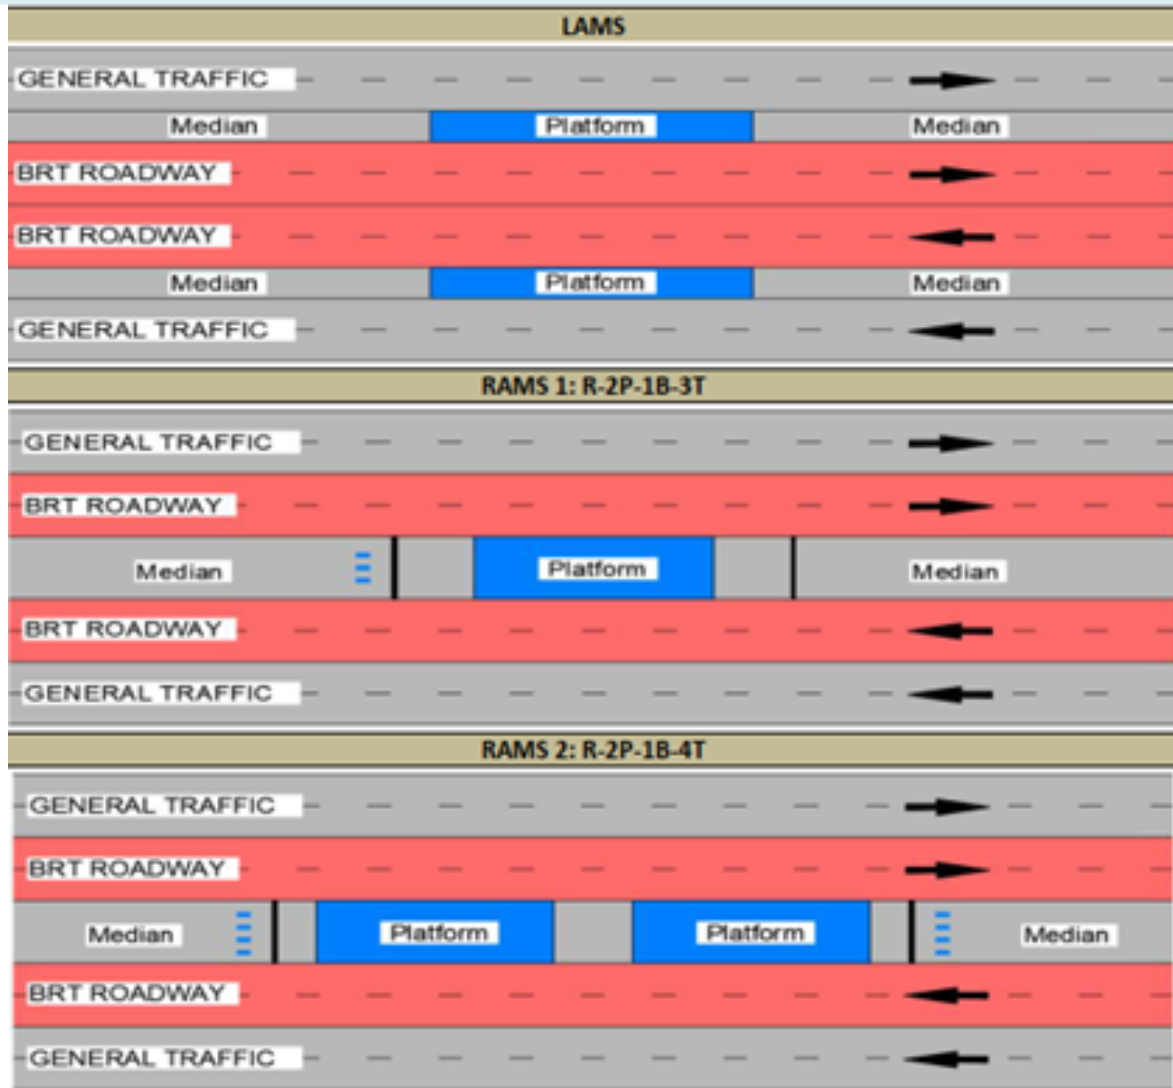

MyCiti Volvo B9LA (18m artic: 131 pax cap)

Model Inputs (Defaults)

| Input | Input Description | Default Values | | | Unit |
|--|---|-----------------|-----|------|-----------|
| | | Kerbside | LAM | RAM | |
| Station Infrastructure Inputs | Station Type ^{*1} | Refer to Legend | | | - |
| | Effective Platform length ^{*2} | 20 | 20 | 20 | m |
| | Effective Platform width ^{*2} | 3 | 3 | 4.3 | m |
| | "Run-off" Length ^{*3} | - | - | 3.0 | m |
| | Kiosk corridor width ^{*4} | - | - | 1.5 | m |
| | Server corridor width ^{*4} | - | - | 1.5 | m |
| | Fare Gate (FG) aisle width ^{*4} | - | - | 0.6 | m |
| | Universally Accessible (UA) Fare Gate (FG) aisle width ^{*4} | - | - | 0.95 | m |
| | Fare Gate (FG) Cabinet width ^{*4} | - | - | 0.2 | m |
| | Fare Gate (FG) Service Capacity ^{*5} | - | - | 24 | Pax/min |
| | Fare Gate (FG) Evacuation Capacity ^{*6} | - | - | 50 | Pax/min |
| | Corridor Evacuation Capacity ^{*6} | - | - | 81.9 | Pax/m/min |
| | Emergency Door Evacuation Capacity ^{*6} | - | - | 89.3 | Pax/m/min |
| | Emergency Door width ^{*2} | - | - | 1.8 | m |
| | Evacuation surge load factor ^{*7} | - | - | 1.5 | factor |
| Max Saturation Level (X) ^{*8} | 60% | 60% | 60% | % | |
| Bus Inputs | No. Bus Doors ^{*9} | 1 | 1 | 3 | no. |
| | Practical Bus Capacity ^{*9} | 111 | 111 | 111 | Pax/bus |
| | Sum of dead time t_m (excluding boarding and alighting time) ^{*10} | 8 | 8 | 10 | sec/bus |
| | Bus boarding/alighting rate ^{*11} | 3 | 3 | 1.5 | sec/pax |
| | Min Pax threshold warning at platforms ^{*12} | 10 | 10 | 10 | Pax/plat |

Model Typologies

k: ticket kiosk
t: turnstiles / fare gates
E: Evacuation gate

Model Output Criteria (1/2)

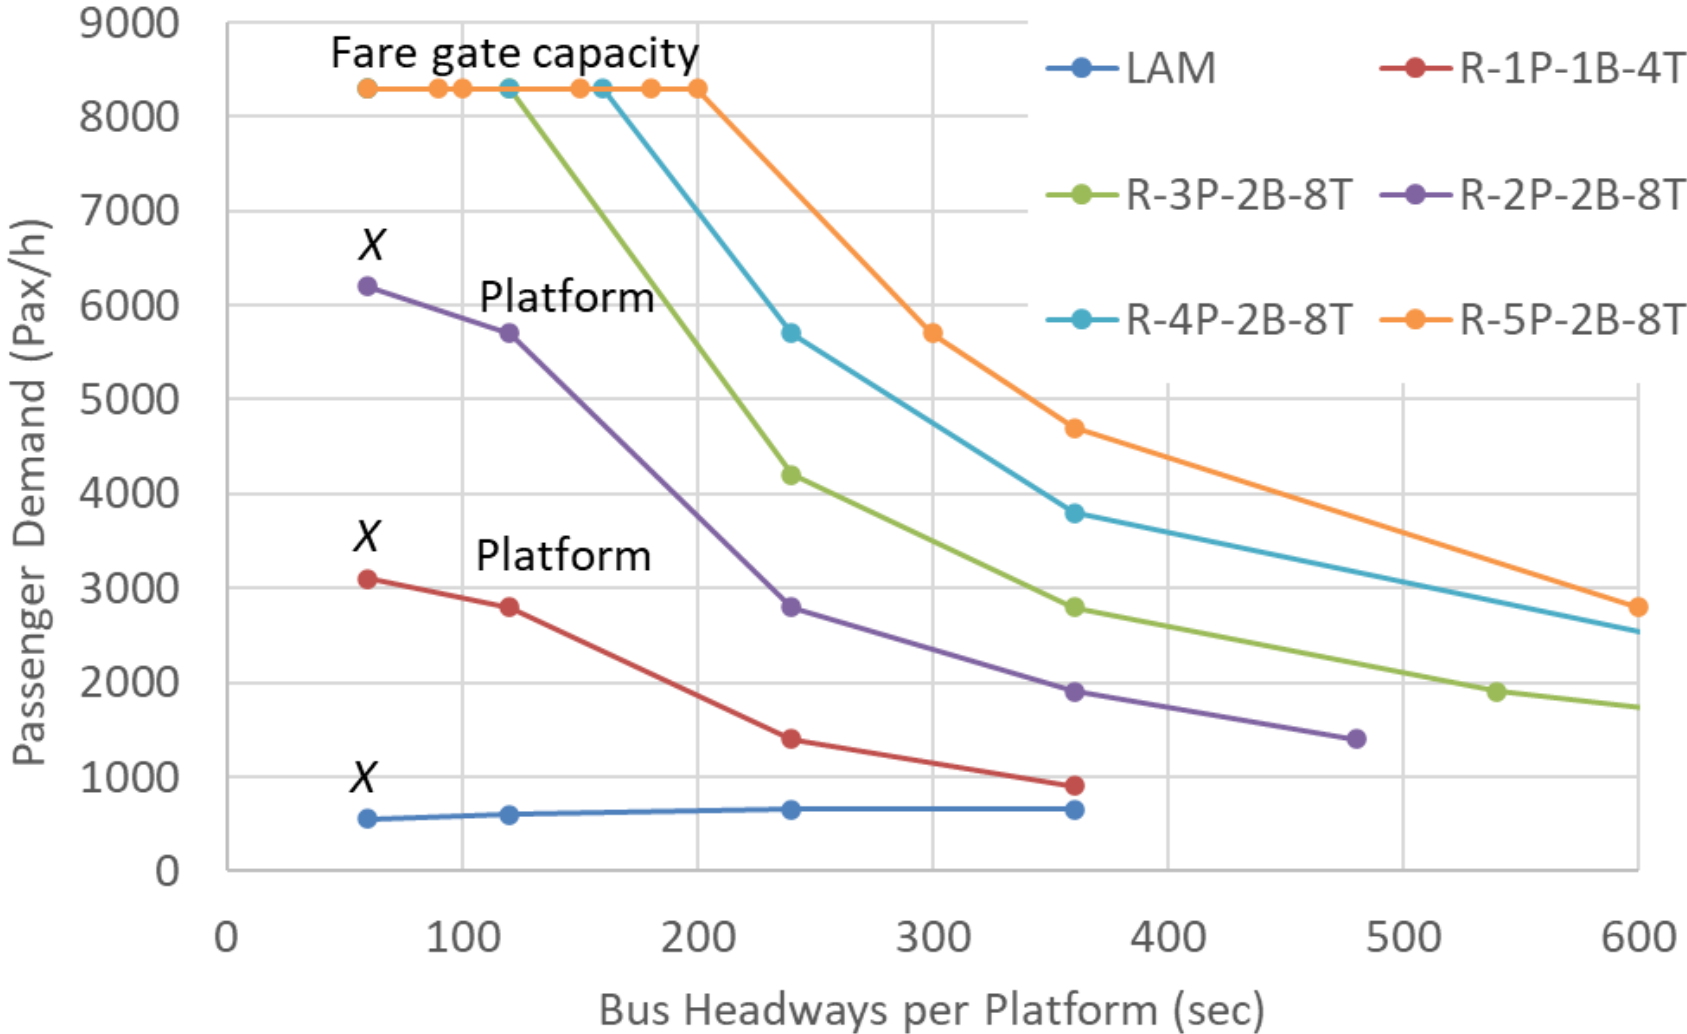

| Output | Unit | Output Description |
|---|-------------------|---|
| Bus headways per platform (H_w) | Sec/bus | Cells output values are highlighted red if $H_w < 80$ <u>sec</u> and highlighted amber for the $80 < H_w < 120$ condition. |
| Low Boarding Pax alert | Pax | Cell output values are identified as "Low" if the calculated boarding pax is less than the threshold defined under the "Inputs" tab (Row 37) Default at 10 pax |
| Boarding Pax | % of Bus Capacity | Cells output values are highlighted red if Boarding values exceed the bus passenger capacity defined in the "Inputs" tab (Row 25). |
| Alighting Pax | % of Bus Capacity | Cells output values are highlighted red if Alighting values exceed the bus passenger capacity defined in the "Inputs" tab (Row 25). |
| Platform Saturation (X) | % | Percentage of time (of the peak 1 hour) that a platform is occupied by a bus. Cell output values are highlighted red if Saturation levels > 60% (60% is the default X value). |
| Fare Gate (FG) Volume (q) to Capacity (c) ratio | q/c | If cells values q/c < 0.8 then this indicates stable queue; If cell values q/c < 0.9 then unstable queues are <u>expected</u> and cells are highlighted amber; If cell values q/c > 0.9 then infinite queueing can be expected and cells are highlighted red. |
| Average Fare Gate (FG) Queue length | Pax | Based on a M/M/1 single server queuing system (p177, Van <u>As</u> and Joubert, 1993) where Average queue length = $(q/c)/(1-q/c)$ |
| Run-off Length Adequate? | OK/Not OK | The run-off length is considered acceptable if the q/c (at LOS C/D queue density threshold) > FG q/c. |
| Kiosk Corridor LOS* | LOS ^{*1} | LOS A < 23 Pax/m/min, LOS B < 33 Pax/m/min, LOS C < 49 Pax/m/min, LOS D < 66 Pax/m/min, LOS E < 82 Pax/m/min, LOS F > 82 Pax/m/min |
| Server Corridor LOS* | | |
| Worst Platform LOS ^{*3} | LOS ^{*2} | LOS A < 0.5 m ² /pax, LOS B < 0.9 m ² /pax, LOS C < 1.4 m ² /pax, LOS D < 2.3 m ² /pax, LOS E < 3.3 m ² /pax, LOS F > 3.3 m ² /pax |
| Average Platform LOS ^{*4} | | |
| Evacuation via Fare Gate (FG) | OK/Not OK | If NFPA 130 "Test 1" Evac time < 4 min, then "OK". If Evac time > 4 min, then "Not OK". |
| Evacuation via Emergency Gate | | |
| Kiosk Corridor Evacuation | | |

Model Outputs (2/2)

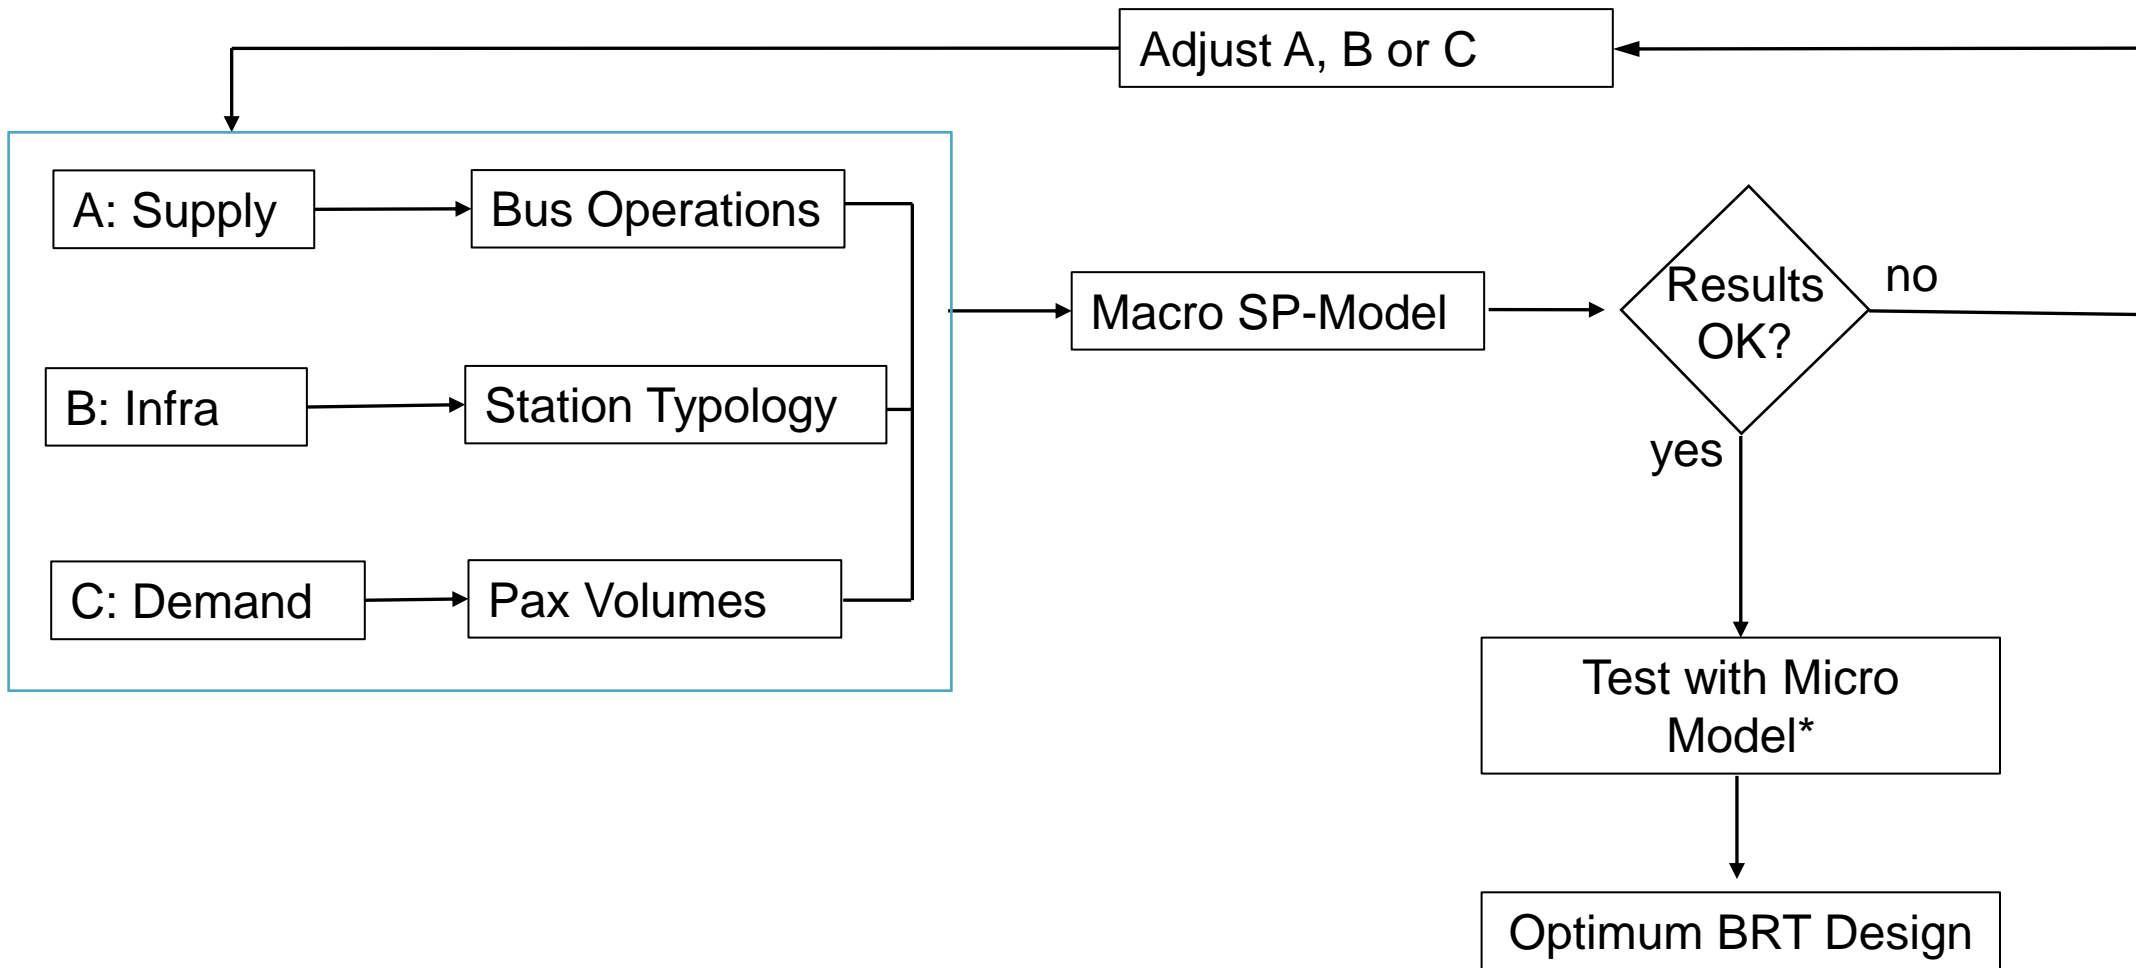

STATION PARAMETER ASSESSMENT

| No. | Station | Pax Vol (Pax/hr) | Typology | Bus Freq (Bus/hr) | Combined Station Hw (Sec/bus) | Hw per Platform (sec/bus) ¹ | Required Dwell Time in peak dir (sec/bus) | Low Boarding Pax Alert (< 10 pax) | Boarding Pax (% of bus cap) ² | Alighting Pax (% of bus cap) ² | Platform Saturation (X) (%) ³ | Platform width wide enough for Fare Gates ? | Fare Gate (q/c) ⁴ | Ave Fare Gate Queue length (pax) | Run-off Length Adequate ? | Platform Saturation (incl Surge factor + Fare Gate limit) (%) ⁵ | Kiosk Corridor LOS | Server Corridor LOS | Worst (Max) Platform LOS | Average Platform LOS | Evac via Fare Gates | Evacuation via Emergency gate | Kiosk Corridor Evacuation |
