

Harnessing the exponential wave of change

The exponentially sustained doubling of the price performance of computing and the convergence of technologies is profoundly impacting the shape of our future world, with a rate of change that is unprecedented. This is impacting commercial operating models, challenging regulators to have regulation that is relevant and workable, and changing how consumers behave and live. It brings with it opportunities (like improved health care and resource management), as well as challenges (such as employment, trust and security).

Sue will give a fast paced overview of exponentially accelerating technologies which are driving these changes, and how this is playing out, which will stimulate us all to think what this may mean in the RMA world. She will introduce how these changes will influence policy making and implementation related to the RMA.
