

My Flood Risk app informs citizens in a comprehensive way on flooding and potential consequences to become more resilient to flooding. The first version has been launched in the Netherlands and informs citizens on potential consequences in case of flooding. Recently the app has been launched in Accra as The my Flood Risk Accra app. The My Flood Risk App Accra (1) informs citizens on the local potential consequences in case of flooding, (2) provides information in the form of infographics how to become more resilient to flooding using prevention, preparedness, emergency response and recovery action and (3) uses official forecasts to provide warning to citizens in case of high rainfall. The app has been developed through community participation primarily involving the GIZ (Deutsche Gesellschaft für Internationale Zusammenarbeit), GMet (Accra Metrological Service) and three local municipalities. This Accra app is made in the scope of the project 'The Strategic Alliance - Developing Risk Management Approaches for Climate and Health Risk (SAGABI Project) in Ghana' by the GIZ and Allianz. It is one of the aspects in the project to build capacity and increase climate resilience through the ICRM approach.

### Ensure Free Flow of Water

Gutters can get choked with solid waste if it is not well managed.

Avoid dumping waste into gutters.

Clean gutters at least every 2 weeks.

Avoid leaving refuse close to gutters.

Place bins at vantage points and educate people on proper waste management.
