

Understanding climate and environmental change

Global climate and environmental changes present significant challenges for current and future generations. In this session we encourage submissions from the full spectrum of climate and environmental research, with presentations having a key focus on (but not limited to): (i) analyses of present climate trends/impacts; (ii) climate/environmental reconstruction from geological archives (recent to deep time); (iii) interactions between humans, climate and environment; and iv) computer modelling of past/present climate and environmental change. This session is a 'Friends of the Pleistocene' GSNZ Special Interest Group
