

Automated provisioning and security of cloud networks

Today's modern higher education operations teams need to provide a secure environment for their users to both protect the end user and also the organisation. This is not new, but the complexity of networks and diverse endpoint mix requires automated practices built around a zero-trust model.

Arista CloudVision along with their Macro Segmentation (MSS) solutions are addressing these requirements by building systems to support a modern NetDevOps style of operations with adaptable and flexible business driven workflows. Integration into best of breed security products such as NSX, Palo Alto, Fortinet, Checkpoint and Forescout, help to deliver these solutions in an open and highly programmable way.
