

TITLE:

An Architecture Led Approach to a Security Fabric Future resulting in USC's 'FortiCorn'

ABSTRACT:

An opportunity arose at USC to revolutionise security across the entire environment, starting with the replacement of the firewalls protecting both the edge and the core of the network. This solid foundation has enabled USC to find their unicorn by further expanding their security teams capability through the Fortinet Security Fabric to quickly and easily identify and contain threats within the network.

This presentation will detail:

- The problems faced by USC with previous security solutions
- The architecture led approach taken by USC in the development of the Fortinet solution
- How USC are able to use the Fortinet platform in operations today
- Establishing a security data fabric to improve data sharing, access, and discovery across multiple security devices and applications.
- Rebuilding stakeholder confidence in the network security platform after years of instability.
