Abstract

Anthropization modalities following climate changes and the environmental and social limits to development that have emerged since 1972 must change. This means that territories and cities must be rethought according to a democratic process connected to an ecological vision integrated with an economy that respects the logic of nature. The objectives are those of the UN Agenda 2030 for sustainable development, with the philosophy of the Green Deal and then translated into the National Recovery and Resilience Plans.

The Session intends, starting from the understanding of the critical processes of our development, to bring theoretical reflections, on good practices, on the great opportunities possible thanks to renewable resources and artificial intelligence, namely: sustainable communities, socially and environmentally, bio-architecture, Energy Communities, Green communities, solidarity networks and immaterial networks, circular economy.

The Session is in continuity with the research line "Integrated planning and design of ecological territories and cities" started over a decade ago and also carried out in the Annual Scientific Conferences of the AISRe and in the Congresses of the European Regional Science Association.
