# Tidal ocean-induced magnetic signals

## Tidal-induced magnetic signal ( $M_2$ )

- **Movement of conductive seawater** through the Earth's magnetic field generates electric currents and **induces** secondary **magnetic signals**

**Swarm observations of the ocean-induced magnetic fields as source of information about the ocean system**

# EM signal dependencies

Electric source:  $\mathbf{J} = \sigma \cdot (\mathbf{U} \times \mathbf{B}_{\text{earth}})$

Conductivity  $\sigma$

Transport  $\mathbf{U}$

whole water column

► Used to derive the ocean heat content

# EM signal dependencies

Electric source:  $\mathbf{J} = \sigma \cdot (\mathbf{U} \times \mathbf{B}_{\text{earth}})$

Conductivity  $\sigma$

Transport  $\mathbf{U}$

whole water column

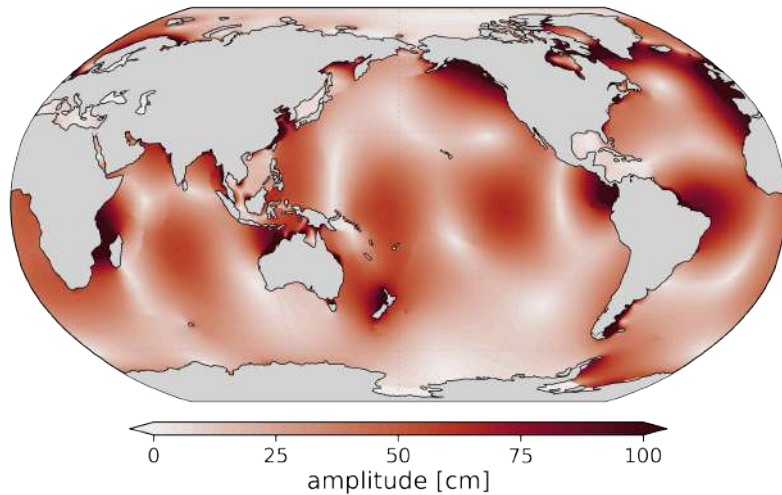

► Used to derive the ocean heat content

► Inversion?

# Tidal elevations by satellite altimetry

- ▶ Ocean tides are a major driver of ocean global oceanic mixing
- ▶ Global observation of the tides are so far based on **satellite altimetry**
- ▶ Tidal elevations are of high interest and globally well observed

## Tidal elevation of $M_2$

Ocean tidal data  
assimilation model  
HAMTIDE

- ▶ However, deep-ocean **tidal currents are difficult to observe** and not well know

# Poloidal-toroidal decomposition

- ▶ Tidal transports are expressed in poloidal and toroidal components  $\mathbf{U} = \mathbf{U}_P + \mathbf{U}_T$

## Poloidal component ( $\mathbf{U}_P$ )

- ▶ Directly linked to tidal elevation

$$i\omega\xi = -\nabla_h \mathbf{U}_P$$

with the tidal elevation:  $\xi = \hat{\xi} e^{i\omega t}$

- ▶ **Can be easily observed by satellite altimetry**

## Toroidal component ( $\mathbf{U}_T$ )

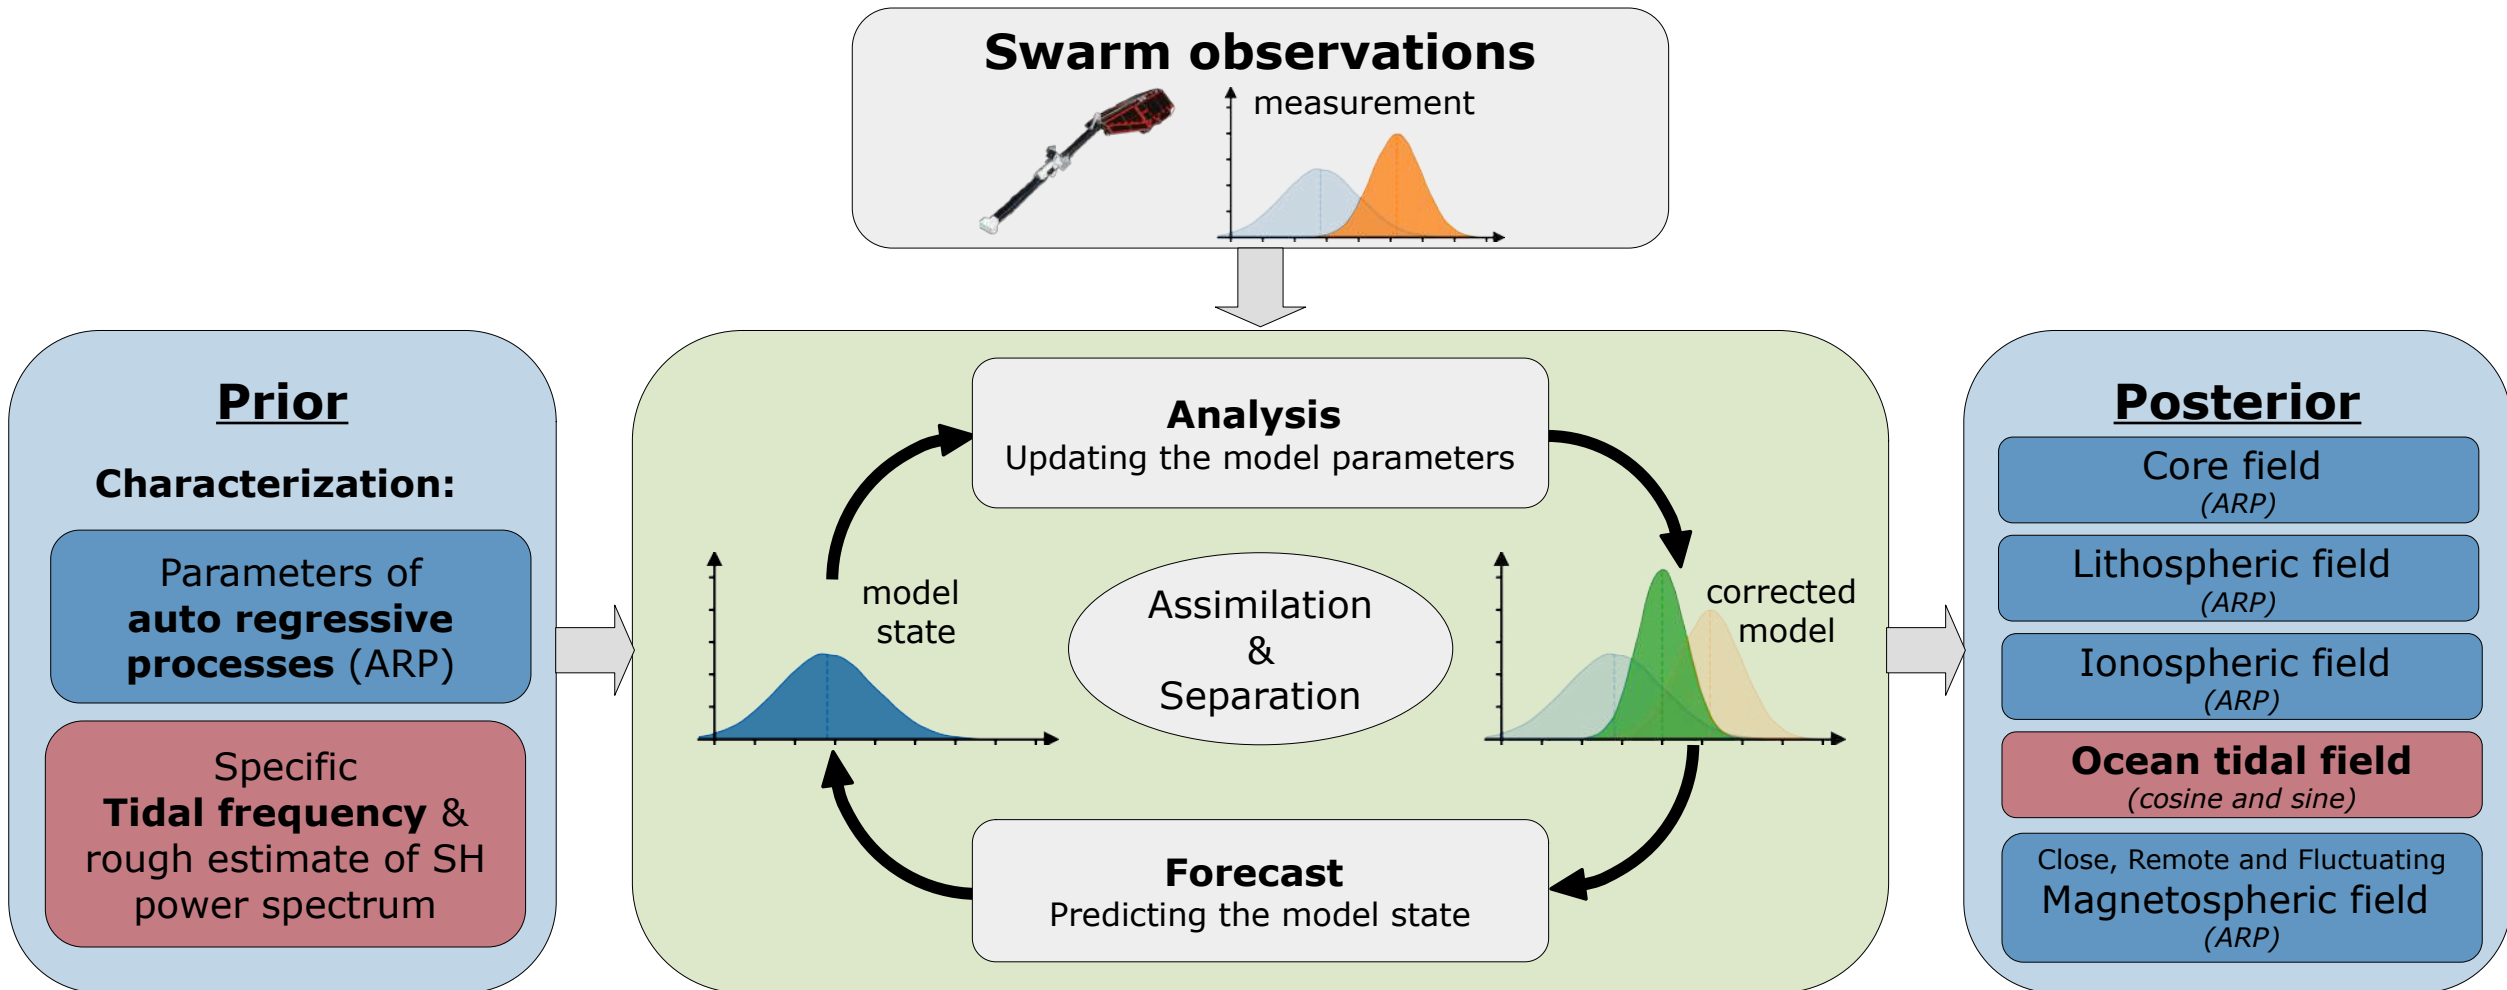

- ▶ Divergence free component
- ▶ Linked to dissipation by friction, mixing, loading and self-attraction
- ▶ Parameters must be well-known
- ▶ **Can be hardly observed by satellite altimetry**

**In contrast:**

- ▶ Magnetic signals are **directly sensitive** to tidal transports
- ▶ Requires only very loose prior assumptions

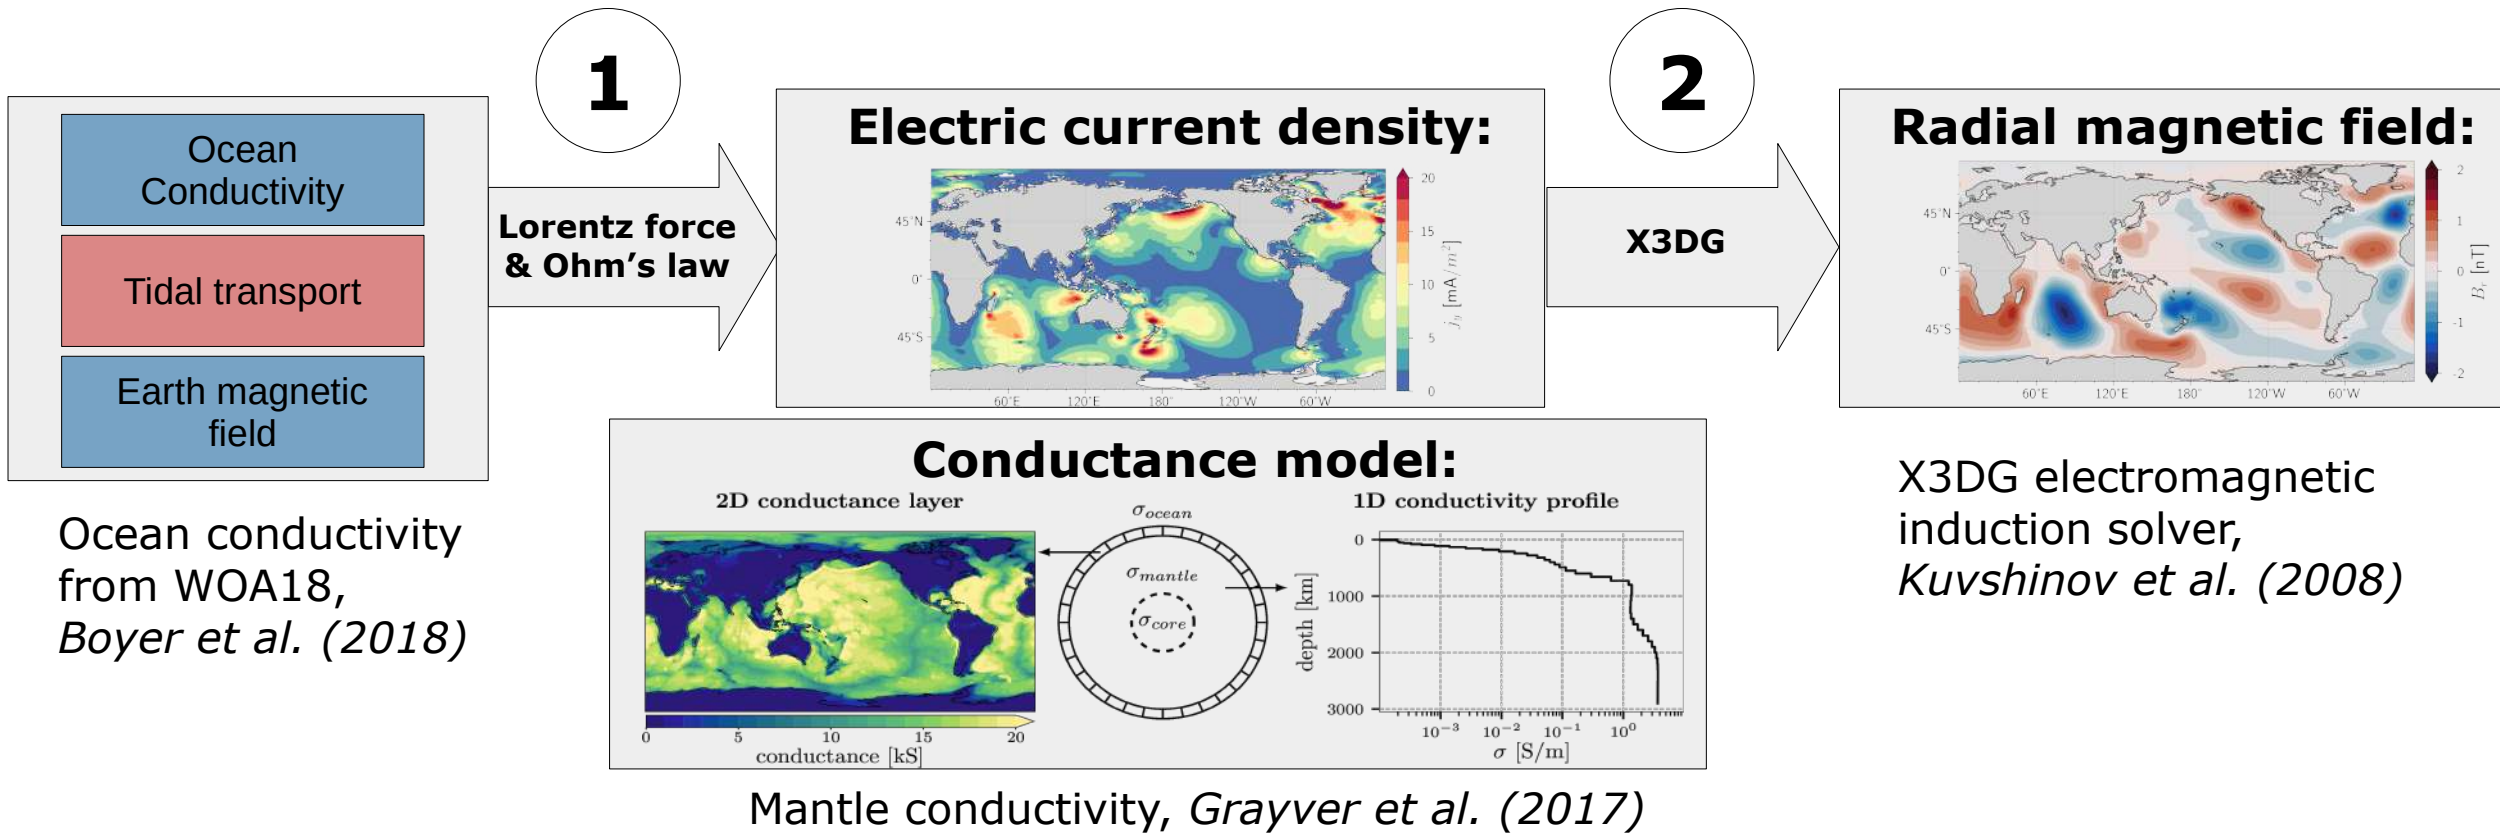

# Kalman filter-based assimilation

- Using Kalman filter inversion: geomagnetic field model **KALMAG** (*Baerenzung et al., 2020,2022*)

# Magnetic field observation operator

- ▶ Incorporate invertible **observation operator** for tidal transports into Kalmag
- ▶ Magnetic field operator consists of two steps:

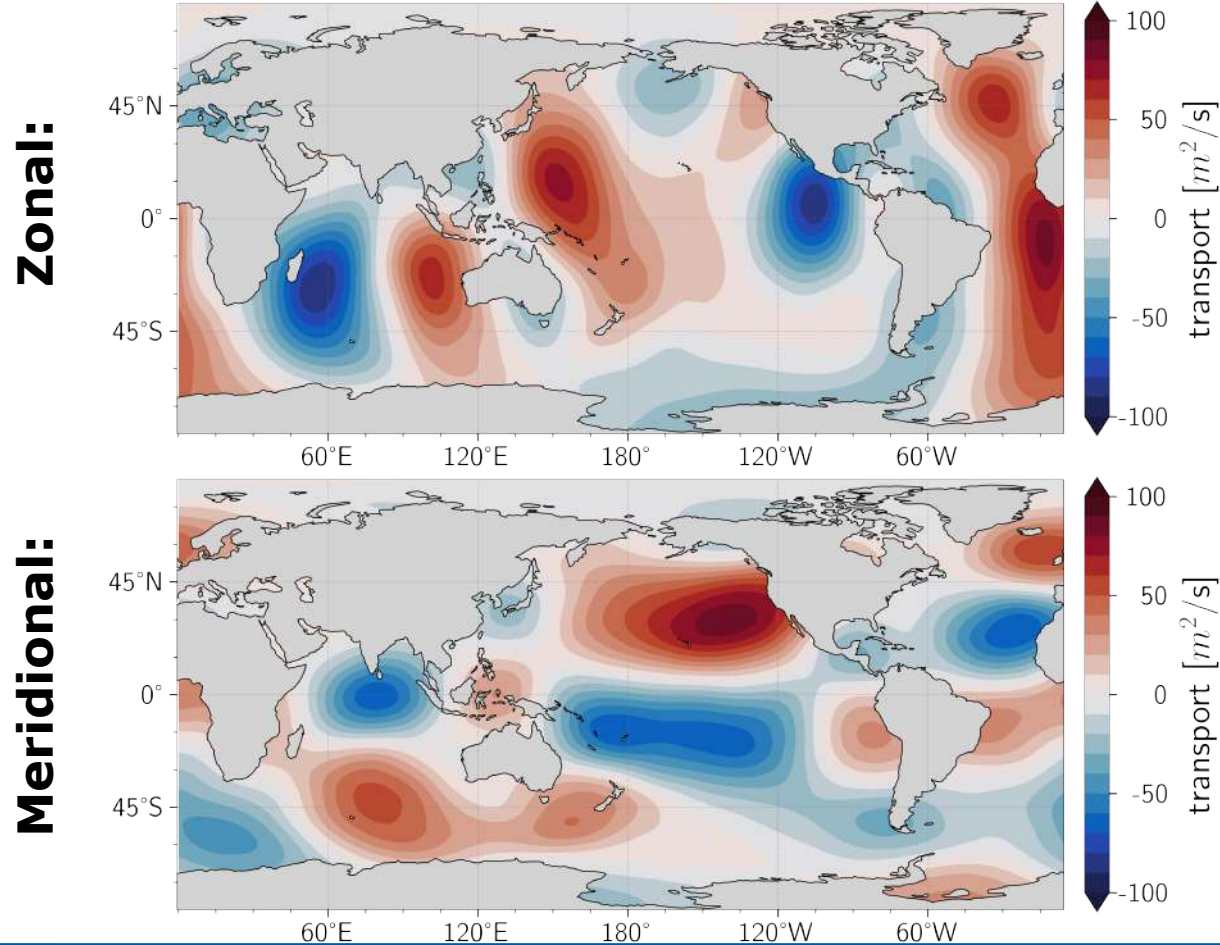

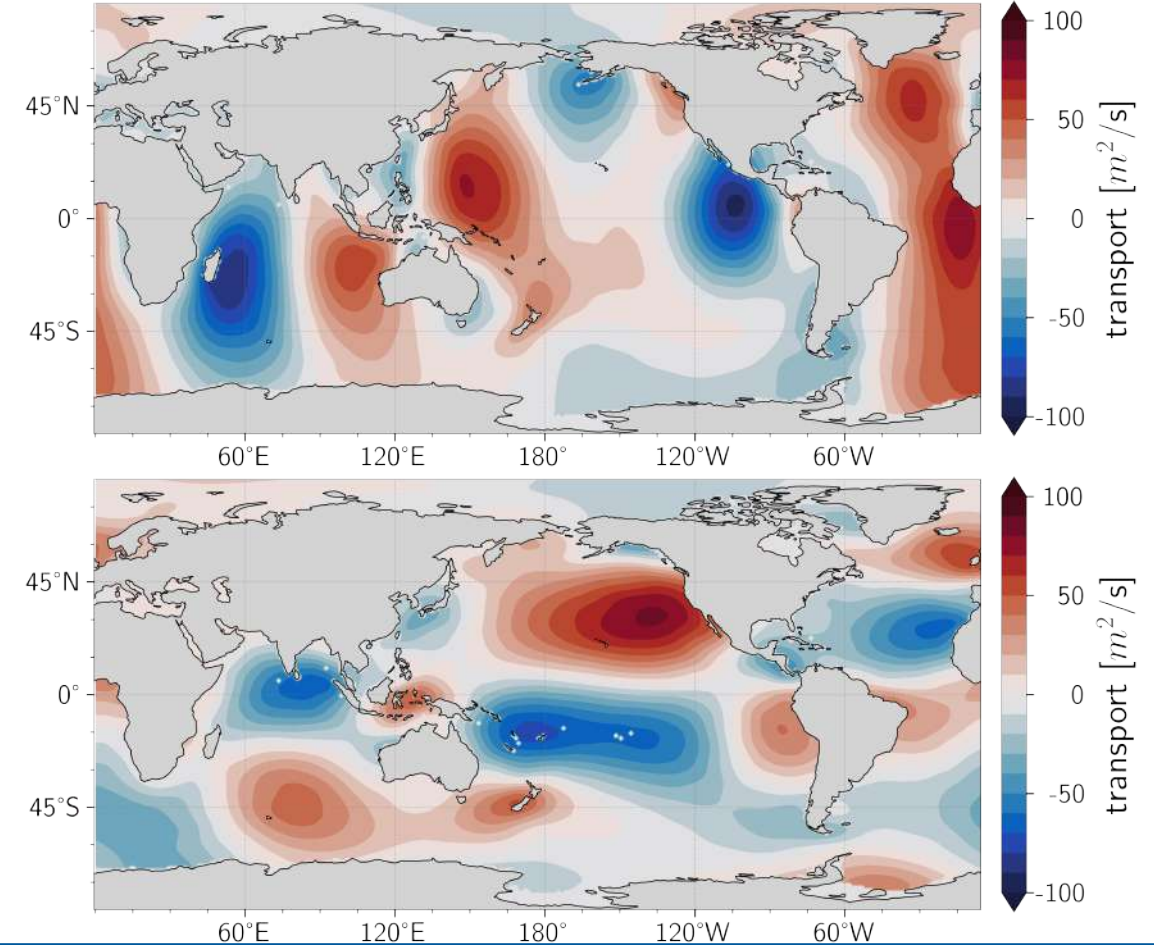

# Estimated tidal transport ( $M_2$ )

- Kalmag-inversion of the *poloidal transport* (real part) from Swarm satellite observations:

## Kalmag estimate:

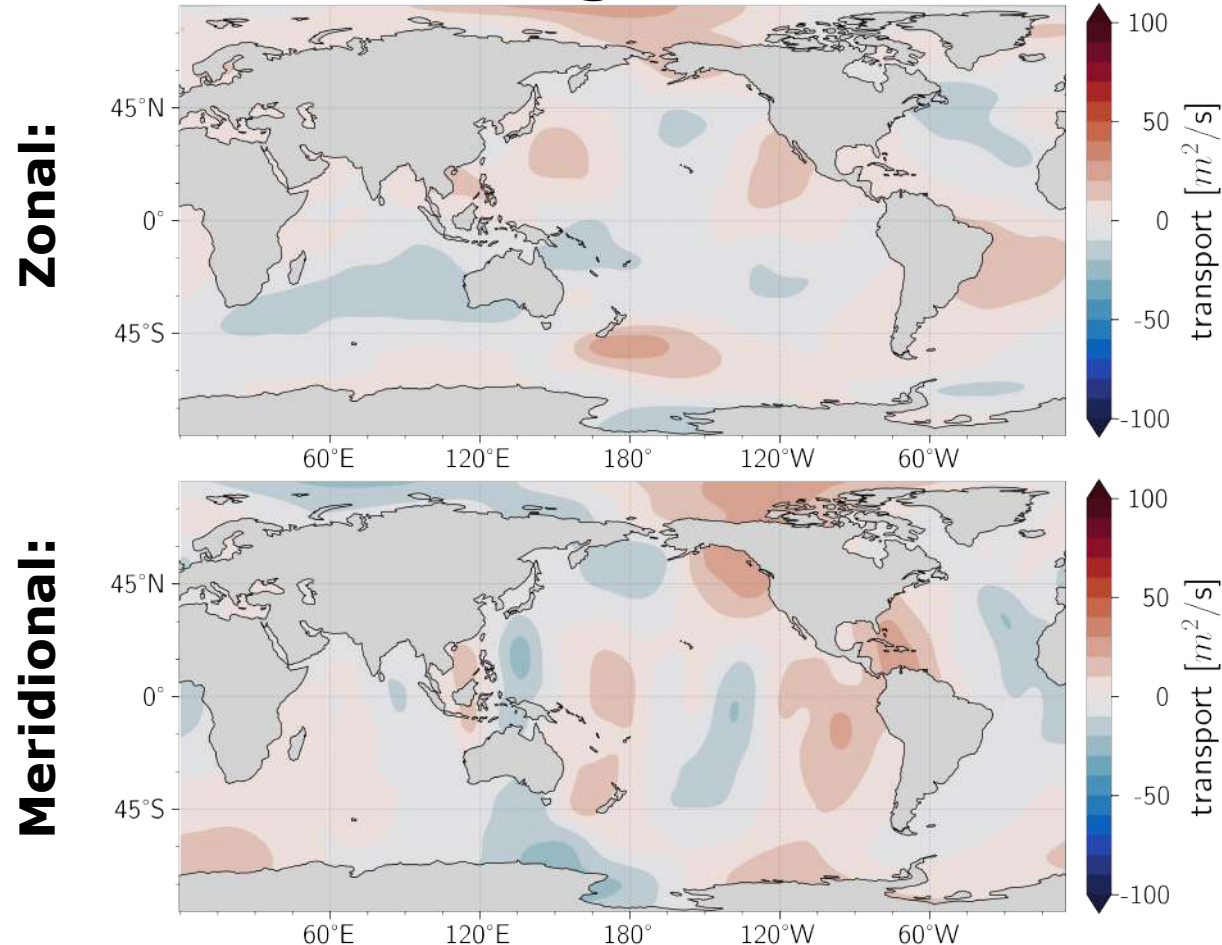

## HAMTIDE comparison:

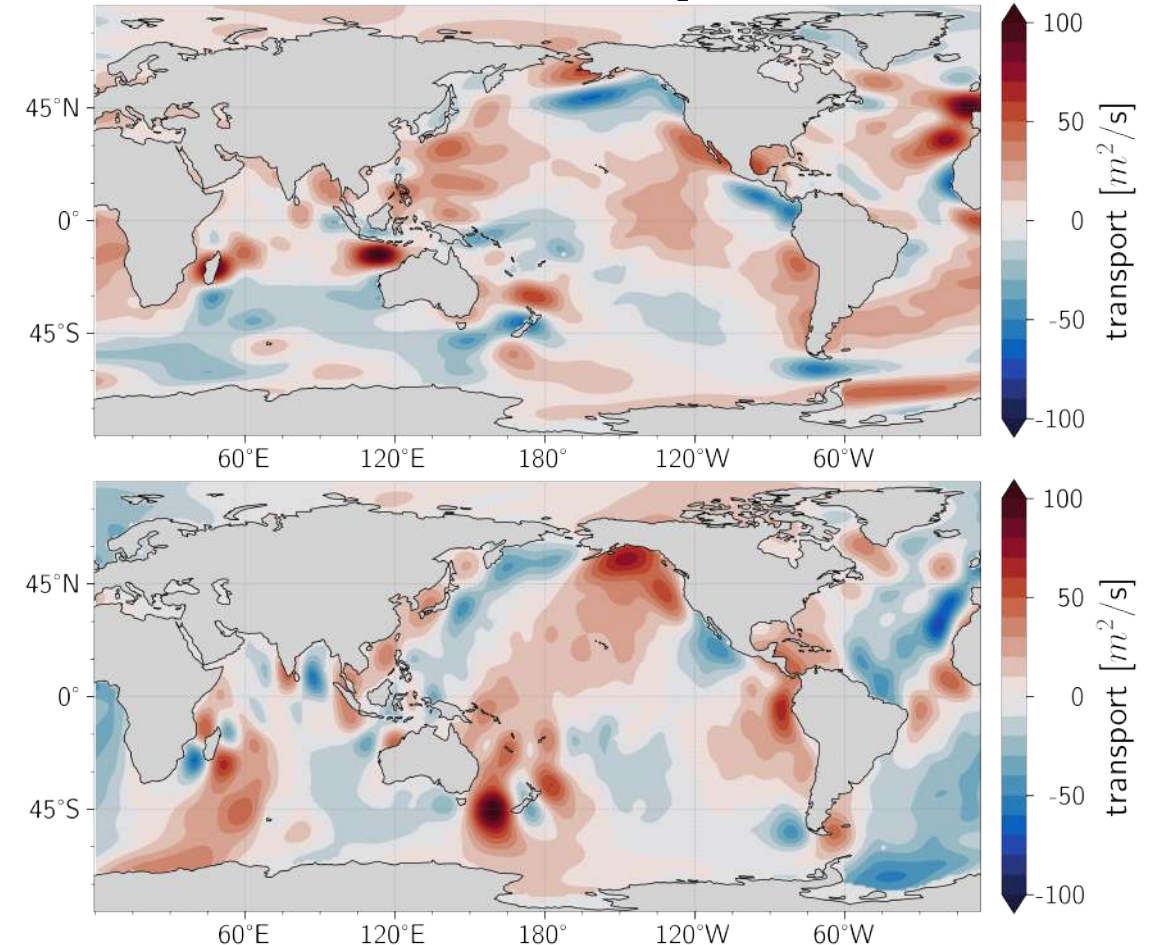

# Estimated tidal transport ( $M_2$ )

- Kalmag-inversion of the **toroidal transport** (*real part*) from Swarm satellite observations:

## Kalmag estimate:

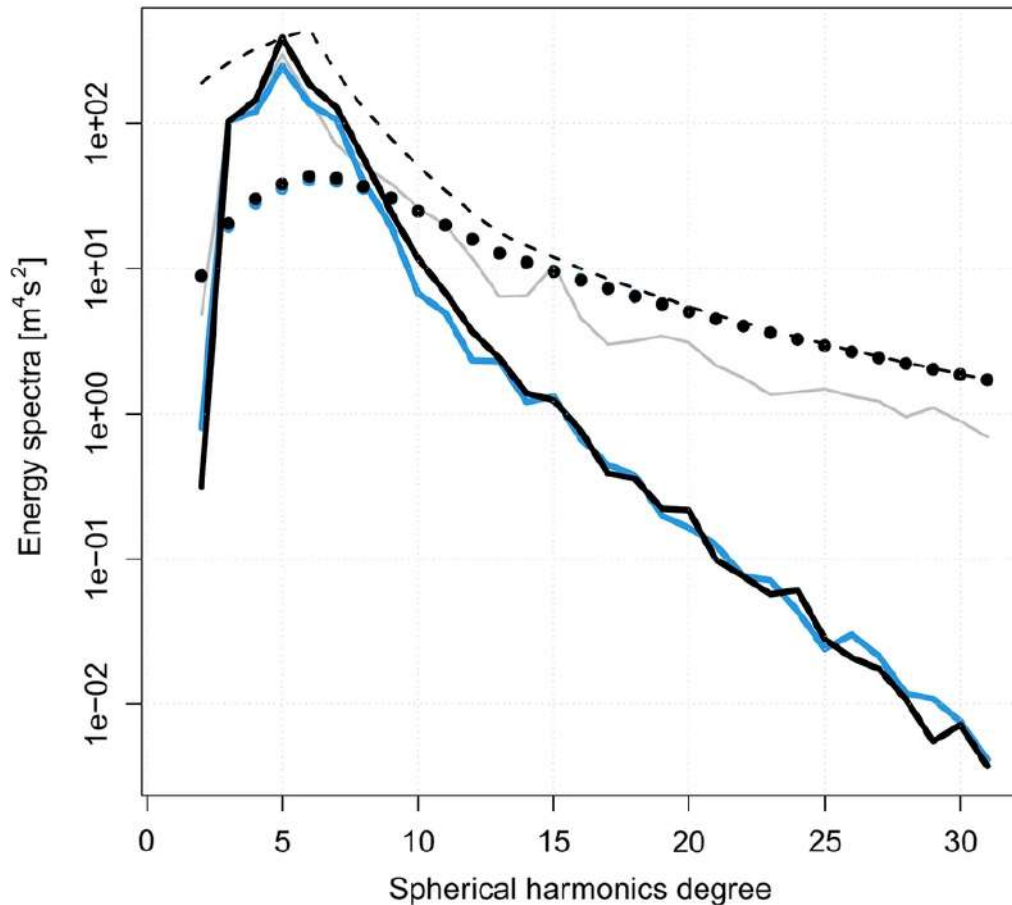

## HAMTIDE comparison:

# Power spectrum of tidal transport

► Spherical harmonics (SH) power spectrum of  $M_2$  tidal transports:

SH spectrum of poloidal transport

SH spectrum of toroidal transport

# Summary & Conclusion

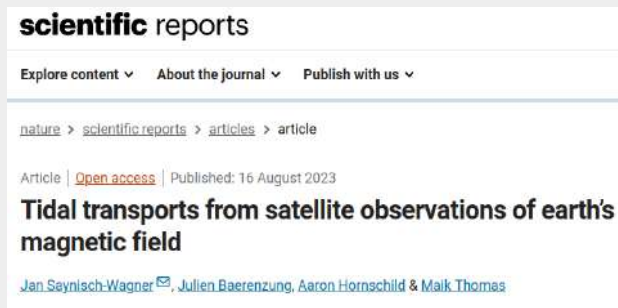

- ▶ We inverted Swarm satellite magnetometer data for tidal transports
- ▶ We used a Kalman filter (Kalmag) for successful inversion
- ▶ Inversion relies on very few prior information

- ▶ Poloidal transport are recovered well, toroidal not

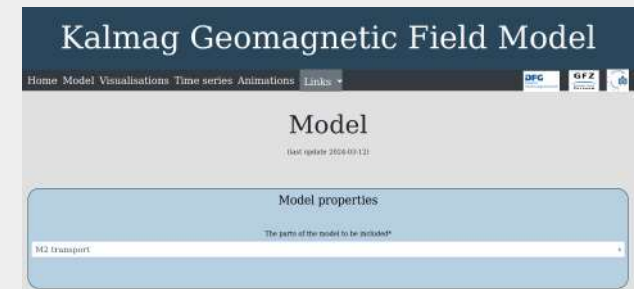

- ▶ Mantle conductivity is minor source of error
- ▶ Ionosphere plays crucial role
