Addressing the impacts of Mediterranean cyclones by integrating a relational geodatabase in ARCHIMEDE Web-GIS platform

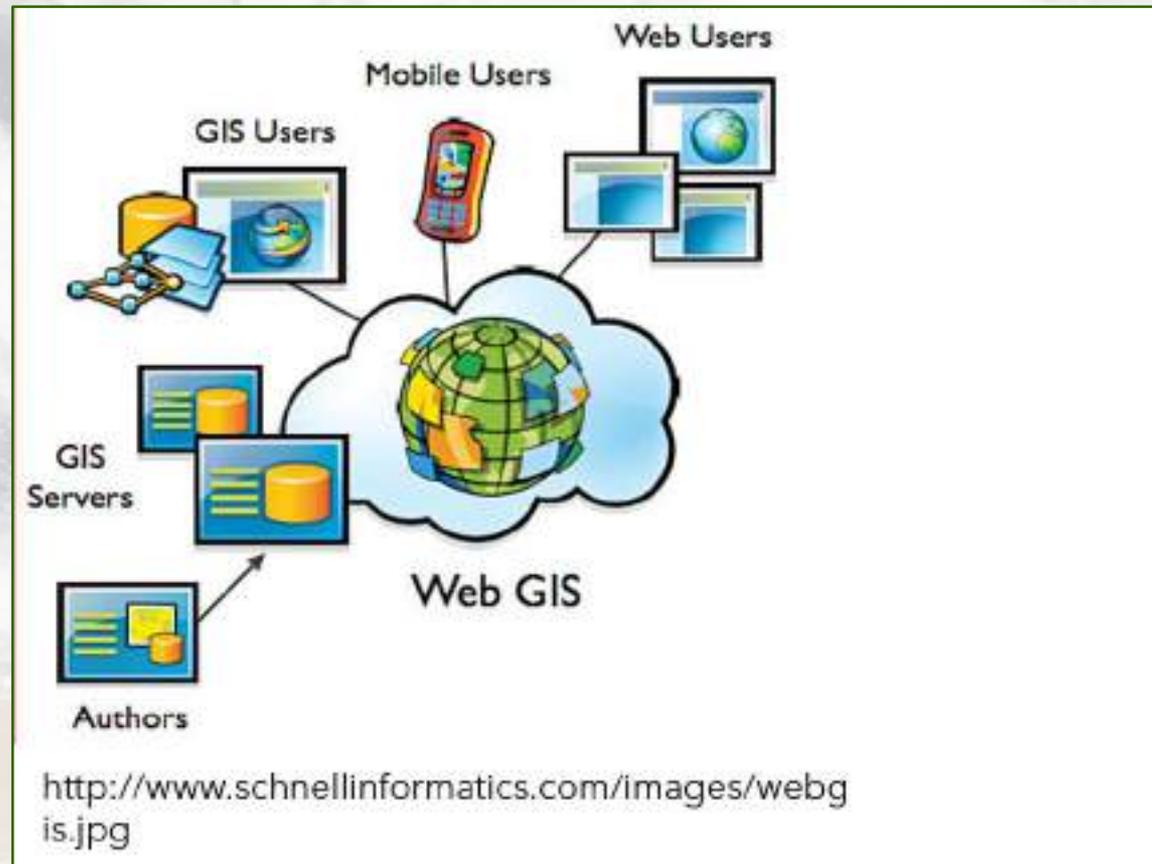

G. Scicchitano – University of Bari

www.archimedemedicane.it

WHAT IS A WEB-GIS

Web GIS, or Web-Based Geographic Information Systems, are GIS platforms that utilize the World Wide Web for the storage, visualization, analysis, and distribution of spatial information via the Internet. The overarching goal of this technology is to allow users to dynamically access, share, and manipulate geospatial data on the web no matter the platform or protocol.

GEOPORTALS

Italian National Geoportal

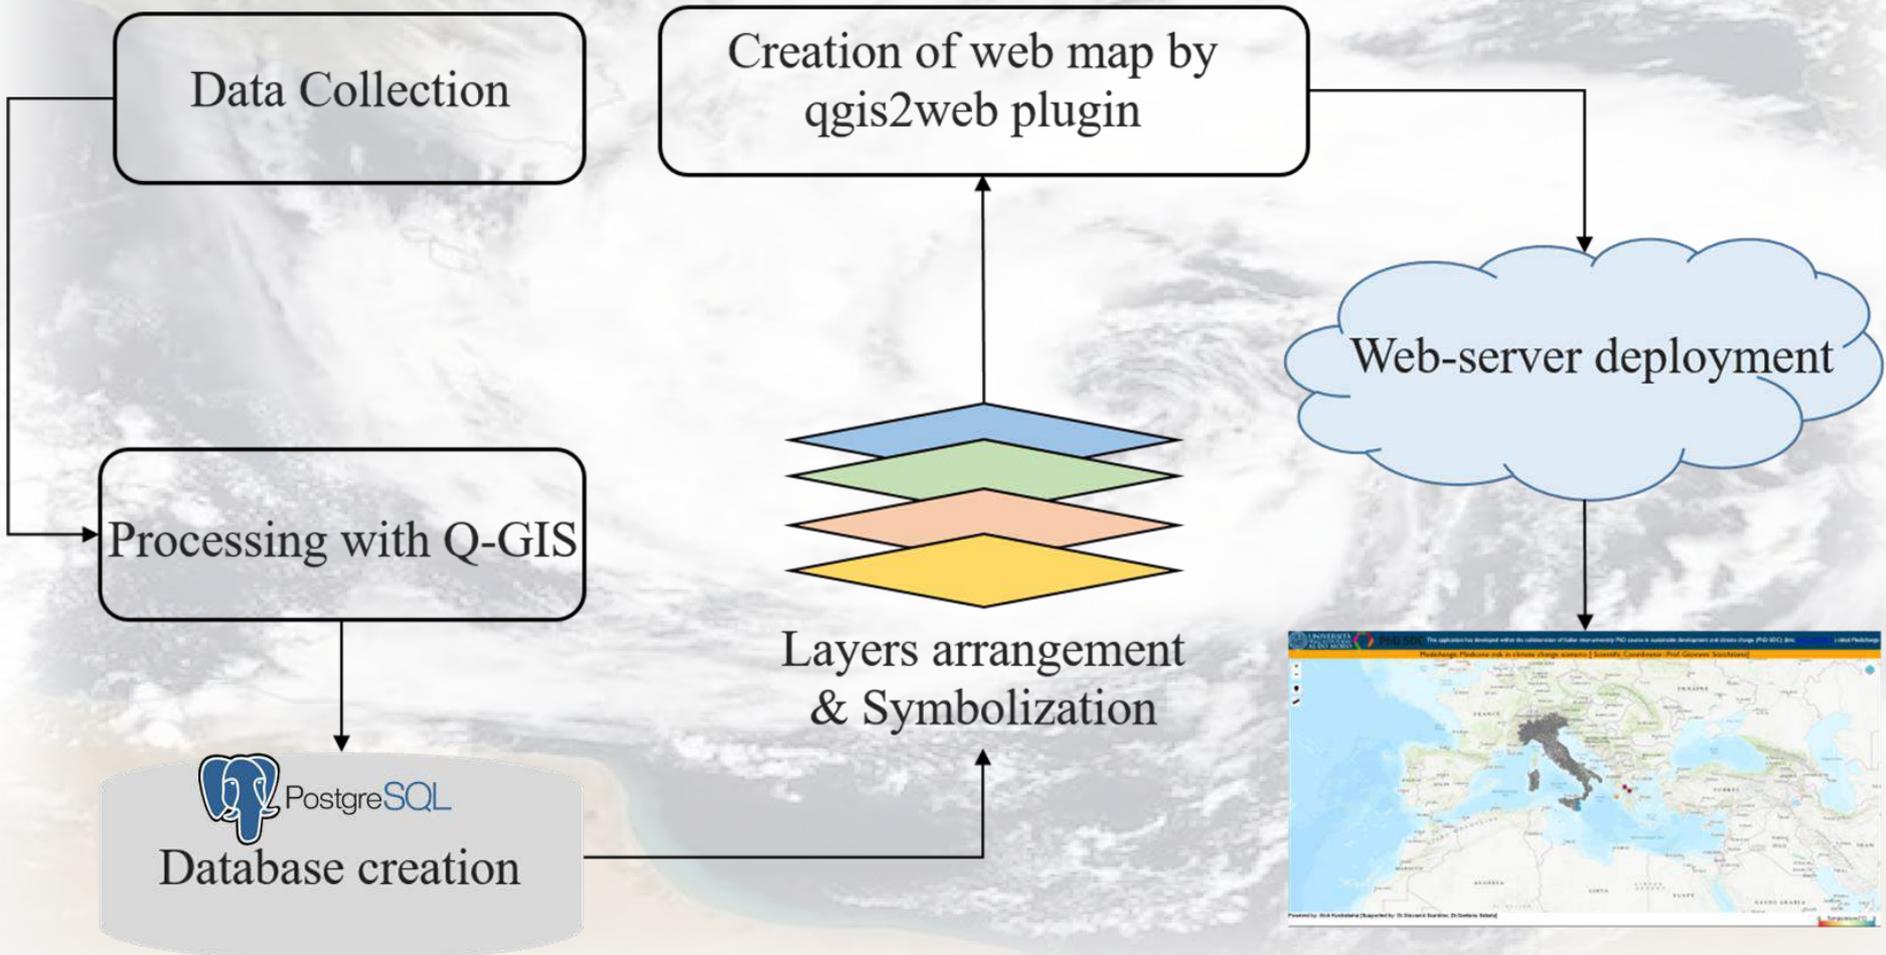

A geoportal is a type of web portal used to find and access geographic information (geospatial information) and associated geographic services (display, editing, analysis, etc.) via the Internet.

Geoportals are important for effective use of geographic information systems (GIS) and a key element of a spatial data infrastructure (SDI).

Geoportal of European Environment Agency

ARCHIMEDE Web-GIS platform

GEODATABASE DESCRIPTION

Archimede Mediane

Multidisciplinary approach to better define vulnerability and hazard of MEDICANES along the Ionian coasts of Sicily - by the Italian Ministry of University and Research (MUR) .
PRIN 2022 PNRR (CUP H53D23011380001) (link: [Archimede Mediane](#))

tary Material) [17]. Extratropical cyclones were selected based on their severity and their significant impact on coastal areas [13–15].

Table 1. The classification of Mediterranean tropical-like cyclones based on an intensity scale. Only extratropical cyclones with an intensity matching this table were considered in this study.

	Mediterranean Tropical Depression	Mediterranean Tropical Storm	Mediterranean Hurricane
Wind Speed (km/h)	<60	64–111	>112
MSLP (hPa)	1006–1015	994–1005	974–993

A relational database was used to store and manage the cyclone data; PostgreSQL was selected because it is an open-source database system that offers excellent support for geospatial datasets through the PostGIS extension and is also capable of integrating a variety of spatial datasets in both vector and raster forms in a web-based application. The

- (1) Cyclone tracks and position derived from MSLP extracted from ERA-5 reanalysis, with tracks and positions based on every 6 h mean sea level pressure;
- (2) SST differences (following the methods reported in Scardino et al. [15]) obtained from the reanalysis of CMEMS (Copernicus Marine Environment Monitoring Service) and satellite data;
- (3) Wind speeds extracted from ERA-5 reanalysis, considering the eastward wind component (U wind) and the northward wind component (V wind), 10 m above the surface with an hourly temporal span;
- (4) Seismic data;
- (5) Old and new geomorphological data.

application through the QGIS2Web plugin. This plugin generates a simple web application containing all of the related files and resources in an organized manner, including basic

GEODATABASE DEVELOPMENT

The ARCHIMEDE geodatabase was initialized by separating extratropical cyclones and Mediterranean tropical-like cyclones

Archimede Medicane Multidisciplinary approach to better define vulnerability and hazard on the Ionian coasts of Sicily - by the Italian Ministry of University and Research (PRIN 2022 PNRR (CUP H53D23011380001) (link: [Archimede Medicane](#)))

A dataset of 51 Mediterranean cyclones

Table 1. The classification of Mediterranean tropical-like cyclones based on an intensity scale. Only extratropical cyclones with an intensity matching this table were considered in this study.

	Mediterranean Tropical Depression	Mediterranean Tropical Storm	Mediterranean Hurricane
Wind Speed (km/h)	<63	64–111	>112
MSLP (hPa)	1006–1015	994–1005	974–993

- Tropical Like Cyclones (TLC)
 - Mediterranean Hurricanes
 - Mediterranean Tropical Storms
 - Mediterranean Tropical Depression
 - Mediterranean Tropical Disturbance
- Extratropical Cyclones (ETC)
- Additional Layers
- Basemaps

Mediterranean tropical-like cyclones were categorized based on their wind speed and mean sea level pressure (MSLP), following the standards of the German Meteorological Service, which proposed an unofficial classification based on the average peak wind speed of intensity v , following the Saffir–Simpson scale for tropical cyclones

SEISMIC DATA

In geophysics, geology, civil engineering, and related disciplines, seismic noise is a generic name for a relatively persistent vibration of the ground, due to a multitude of causes, that is often a non-interpretable or unwanted component of signals recorded by seismometers.

Microseism is the most continuous and ubiquitous seismic signal on Earth, and is mostly generated by the sea - solid Earth interaction.

SEISMIC DATA

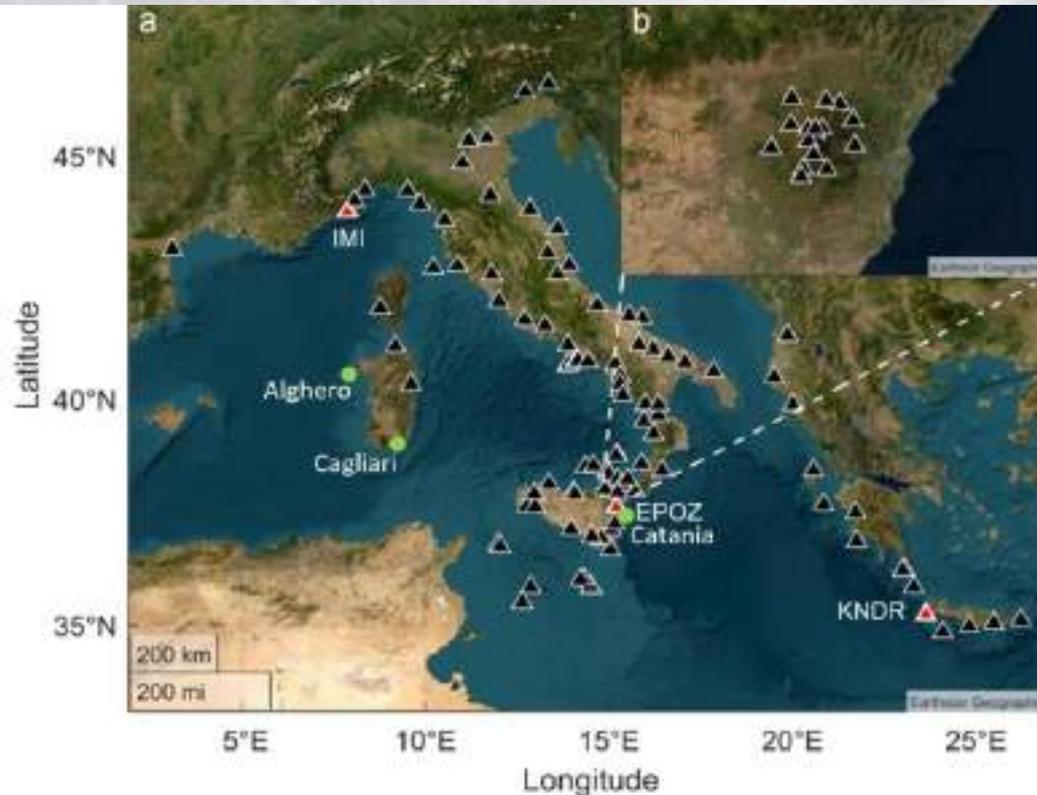

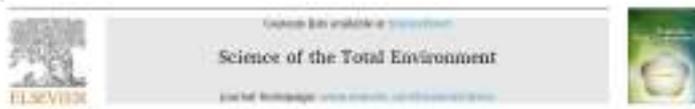

Fig. 3. Satellite image of the Mediterranean area with a selection of the broadband seismic stations available in the ORFEUS and INGV databases and used in the spectral analysis and the grid search method (a) and selection of the broadband seismic stations available in the Etna area maintained by INGV-OE (b), used in the array analysis. The red triangles indicate the stations used in the detailed analysis shown in Fig. 5 and Supplementary Figs. 3, 4, 5, 6 and 7. The green dots indicate the wave buoys used in this study. SST DIFFERENCE DATA

scientific reports

OPEN **Fingerprinting Mediterranean hurricanes using pre-event thermal drops in seawater temperature**

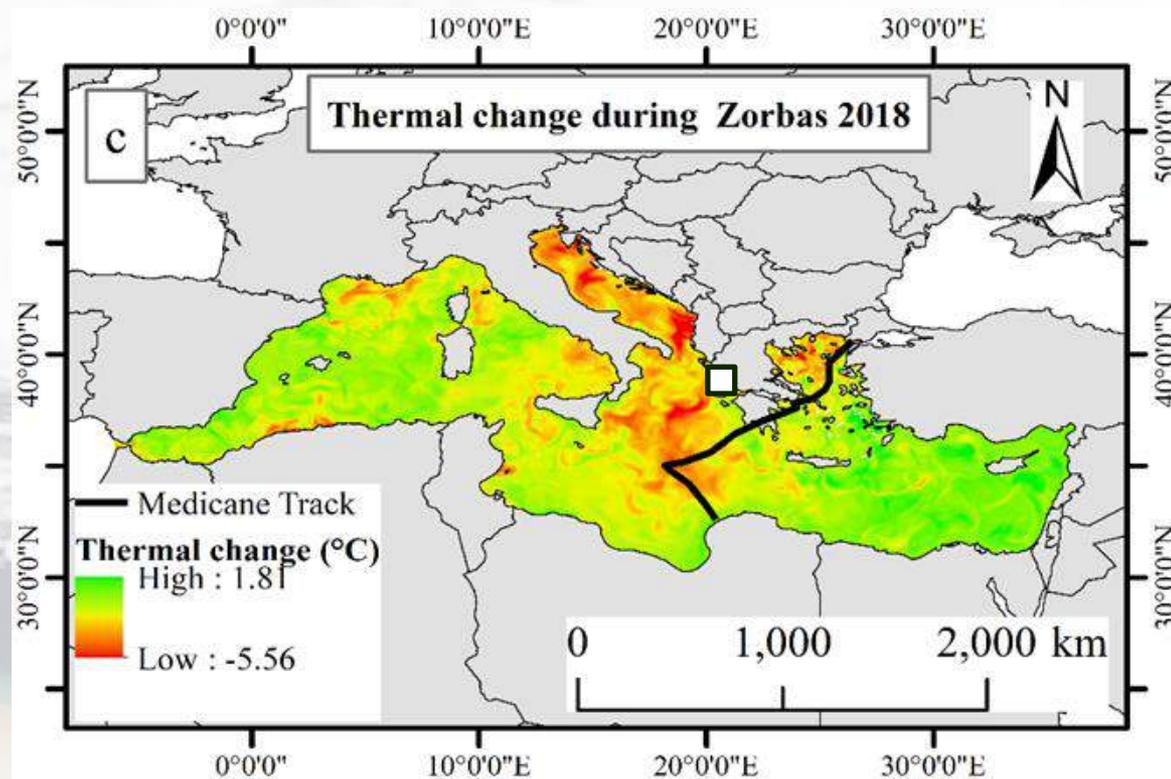

Giovanni Scandino^{1,2}, Mario Marcello Miglietta^{1,3}, Alok Kushnababa^{1,4}, Eliza Casella⁵, Alessio Rovere^{1,10}, Giovanni Besio⁶, Alfo Marco Borzi⁷, Andrea Cannata¹⁰, Gianfrancesco Mazza⁸, Gaetano Salato⁹ & Giovanni Scicchitano^{1,11}

SST is suggested to be an important factor in the mature stages of cyclone development. According to Pytharoulis¹³ and Miglietta et al.³¹ high SSTs promote stronger sea surface fluxes and, consequently, stronger latent heat release due to convection needed for Mediterranean hurricane intensification.

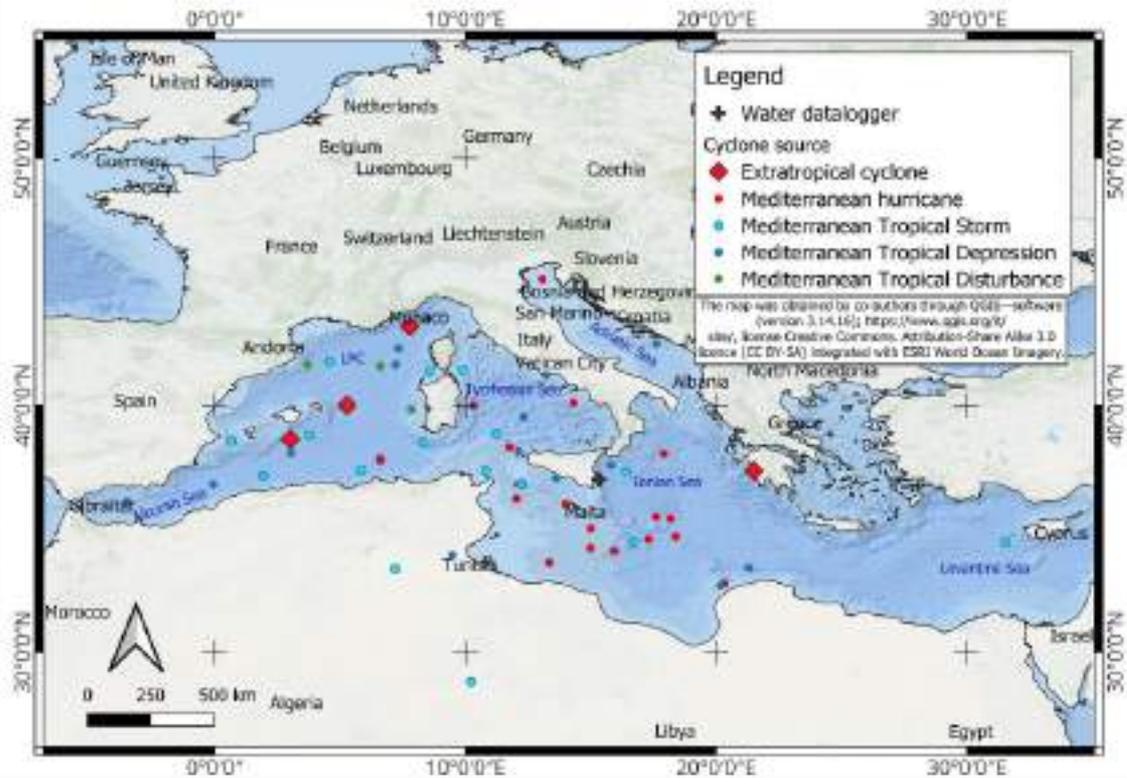

Zorbas 2018

Trend of SST recorded prior to the occurrence of Medicane Zorbas.

SST DIFFERENCE DATA

SST data associated with the occurrence of Mediterranean cyclones using data reanalysis and satellite observations. The “thermal drop” was defined as the difference between the SST 10 days prior to cyclone occurrence and at the end of the cyclone’s lifetime. We chose to measure the SST 10 days before the event to allow us to characterize temperature drops in the environment prior to the occurrence of Mediterranean hurricanes

- Mediterranean Sea Physical Reanalysis (CMEMS MED-Currents Copernicus Marine Environment Monitoring Service (CMEMS), product available from 1987 to 2023
- European Centre for Medium-Range Weather Forecasts (ECMWF) reanalysis v5 (ERA5 from Copernicus Climate Change Service; SST values extracted from 1969 to 1985
- Satellite data observation from CMEMS Reprocessed (REP) Mediterranean (MED) dataset: available from 1982 to 2023.
- Data from the International Argo program, part of the Global Ocean Observing System

SST DIFFERENCE DATA

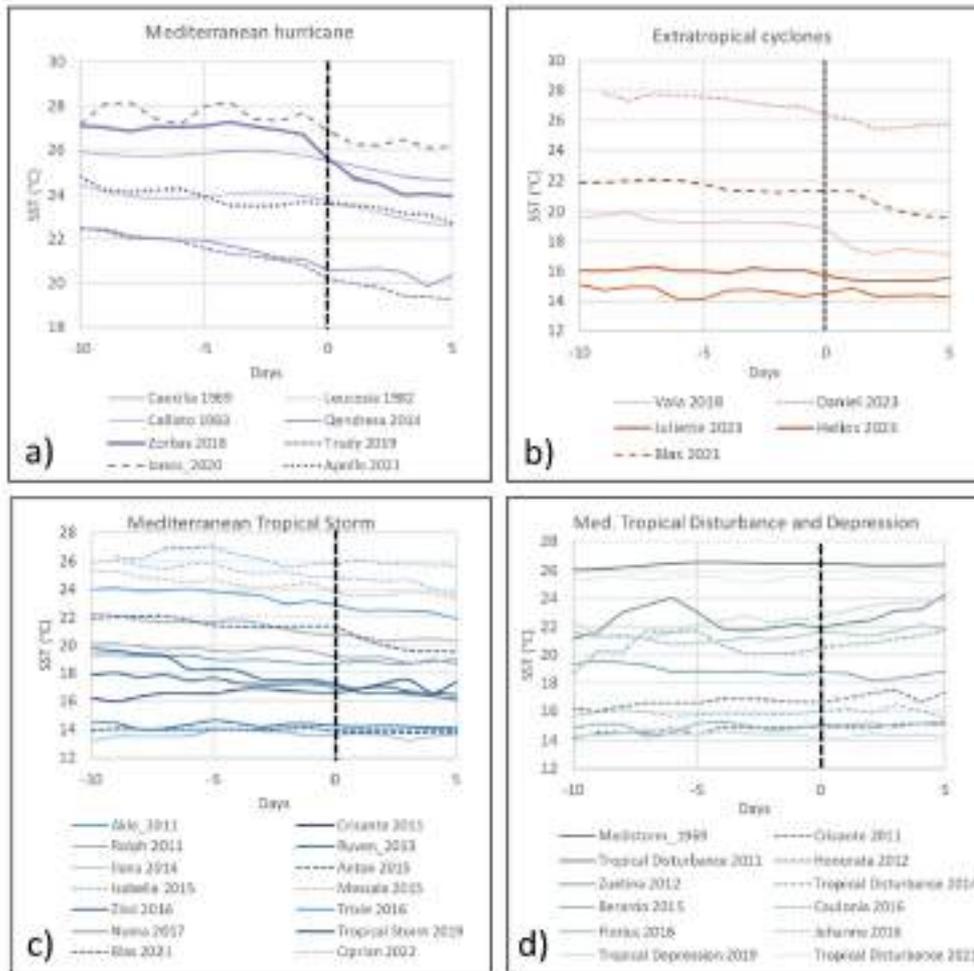

Figure 4. SST time series for cyclone events listed in Table 51. The origin of the x-axis corresponds to the beginning of the event. (a) SST time-series data for Mediterranean hurricanes; (b) SST time-series for extratropical cyclones; (c) SST time-series for the Mediterranean tropical storms; (d) SST time-series for the Mediterranean tropical depressions and Disturbances.

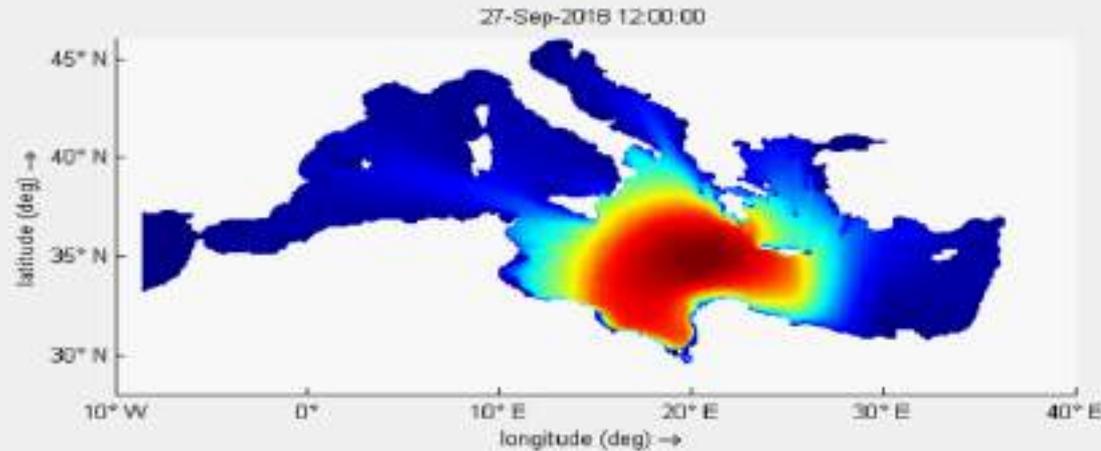

The weather systems associated with the greatest thermal drops were the Mediterranean hurricanes, with thermal drops in a range of 2–3 °C.

The most intense cyclones were characterized by a thermal drop equal to or greater than 1.6 °C

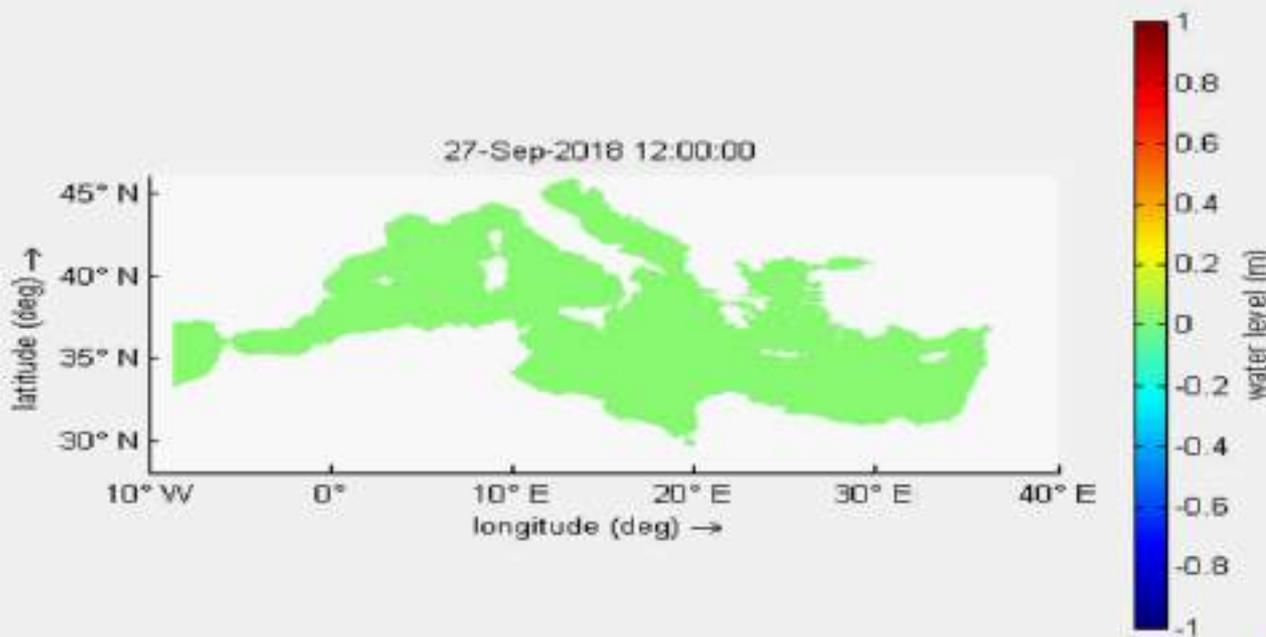

The SST time series also highlighted the onset of thermal drops a few days before the early stages of Mediterranean hurricane formation. In contrast, Mediterranean tropical storms and extratropical cyclones exhibited thermal drops slightly later, mostly during the early phases of the cyclone's lifetimes

Mediterranean tropical depression and disturbance events did not exhibit any significant thermal drops, and in some cases, the SST even increased during these events

HYDRODYNAMIC MODELS
