# Achieving Universal Health Coverage through Public Health Expenditure:

## An analysis of trends in 187 countries between 2000 and 2021

### Henna Bhandari<sup>1</sup>, Aritrik Das<sup>2</sup>, Yukti Bhandari<sup>2</sup>

<sup>1</sup>Hamdard Institute of Medical Sciences and Research, New Delhi, India; <sup>2</sup>Post Graduate Institute of Medical Education and Research, Chandigarh, India

- There was a strong association between public health expenditure and progress in universal health coverage across all 187 countries, and among each World Bank income classification group.
- HICs and UMICs majorly relied on public health expenditure, while LMICs and LICs continued to rely significantly on external contributions for current health expenditure.
- Components of the UHC-SCI may need to be re-evaluated to engineer a shift towards inclusion of secondary and tertiary health services in addition to primary health care.

#### **BACKGROUND**

health coverage (UHC) includes-protection that risks for all.<sup>1</sup> Target 3.8 of Sustainable Development Goals (SDGs) involves achieving UHC.<sup>2</sup>

Between 2000 and 2021, the percentage of the population without access to essential health services dropped by approximately 15% and nearly 60% of the world's population - still lacked access to crucial health services in 2021.<sup>3</sup>

#### **OBJECTIVES**

To understand the trends and linkages between public health expenditure (PHE) and UHC.

#### MATERIALS AND METHODS

- A secondary data analysis was conducted to study the trends and associations between UHC and public health expenditure.
- from \ We analyzed the trends in UHC and PHE between 2000-2021 in 187 countries. We further analyzed trends for the same countries between 2015 and 2021; to understand the patterns developing as progress in UHC coverage reportedly slowed down.<sup>1</sup>
  - Multiple linear regression analysis was conducted to study the associations between UHC-SCI scores and different forms of health expenditure. A variance inflation factor (VIF) of  $\geq 10$  was considered for exclusion of variables, and a p-value of < 0.05 was considered as significant.

Indicators	Definition	Data source		
UHC-SCI	UHC Service coverage index - Composite measure of 14 indicators spanning	WHO Global Health Observatory (WHO-GHO) <sup>4</sup>		
	reproductive, maternal, newborn and child health, infectious disease, non-			
	communicable disease, service capacity and access. <sup>3</sup>			
PHE-GDP	PHE as a % of country's Gross Domestic Product	The World Bank - Organization for Economic		
		Cooperation and Development (OECD) <sup>5</sup>		
CHE	Current Health Expenditure of a country – this includes all types and sources of	OECD <sup>5</sup> and WHO GHO <sup>4</sup>		
	expenditure on health.			
PHE-CHE	PHE as a % of a country's current health expenditure	OECD <sup>5</sup> and WHO GHO <sup>4</sup>		
OOPE-CHE	Out-of-pocket expenditure as a % of a country's current health expenditure	OECD <sup>5</sup> and WHO GHO <sup>4</sup>		
<b>EXT-CHE</b>	External contributions as a % of a country's current health expenditure	OECD <sup>5</sup> and WHO GHO <sup>4</sup>		

#### RESULTS

- •The mean UHC-SCI score of 187 countries, increased by 19.52 (SD=7.31) points, from 46.01 (range - 13.31-83.15) in 2000 to 65.54 (range - 29.4-91.04) in 2021.
- •There was an overall increase of 1.12% (SD=1.82) in PHE-GDP, from 2.99% (range -0.06-22.25%) in 2000 to 4.11% (range - 0.32-12.63%) in 2021.
- •A strong positive correlation was detected between the trends in UHC-SCI scores and PHE-GDP, overall (r=0.845; p-value = 0.017).
- •In LICs, there was an overall decrease of 4% in mean PHE-CHE from 29.06% in 2000 to 23.71% in 2021. In LMICs, an overall increase of 0.6% in mean PHE-CHE was noted, from 38.87% in 2000 to 39.43% in 2021.
- •Strong and significant negative correlation between change in OOPE-CHE and UHC-SCI scores was observed among countries from all income groups. In case of external contributions to current health expenditure (EXT-CHE), the association was significant and strong for LICs and LMICs, but was not significant for UMICs and HICs.

Table 2: Mean change in UHC-SCI and PHE-GDP between 2000 and 2021 among various World Bank income group classifications (n=185)\*

Countries	Mean	UHC-	Mean	Mean	PHE-	Mean	R	p-value <sup>a</sup>
classified by	SCI		change	GDP		change	(Correlation	
income groups	2000	2021	(SD) in	2000	2021	(SD) in	co-efficient)	
(N=185)			UHC-SCI			PHE-GDP		
LIC (n= 22)	19.86	41.14	21.28 (4.37)	1.20	1.42	0.22 (1.06)	0.420	0.030

\*2 countries were not classified by the World Bank <sup>a</sup>estimated using linear regression analysis

Table 3: UHC and PHE Trends during 2015-2021 as compared to trends between 2000-2021

Tat	Table 5. Offic and Fife Helius during 2015-2021 as compared to delius between 2000-2021					
		UHC-SCI progress (%)	PHE-GDP change (%)			
1.	LIC (n = 22)	17.4%	113%			
2.	LMIC (n = 50)	11.7%	48.4%			
3.	<b>UMIC</b> (n = 51)	1.3%	51.8%			
4.	HIC (n = 62)	9.9%	56.8%			

Figure 1: Scatterplot distribution for linear regression analysis between mean UHC-SCI scores and PHE-CHE (%) from 2000-2021 for (a) all 187 countries; (b) LICs (n=22); (c) LMICs (n=50); (d)

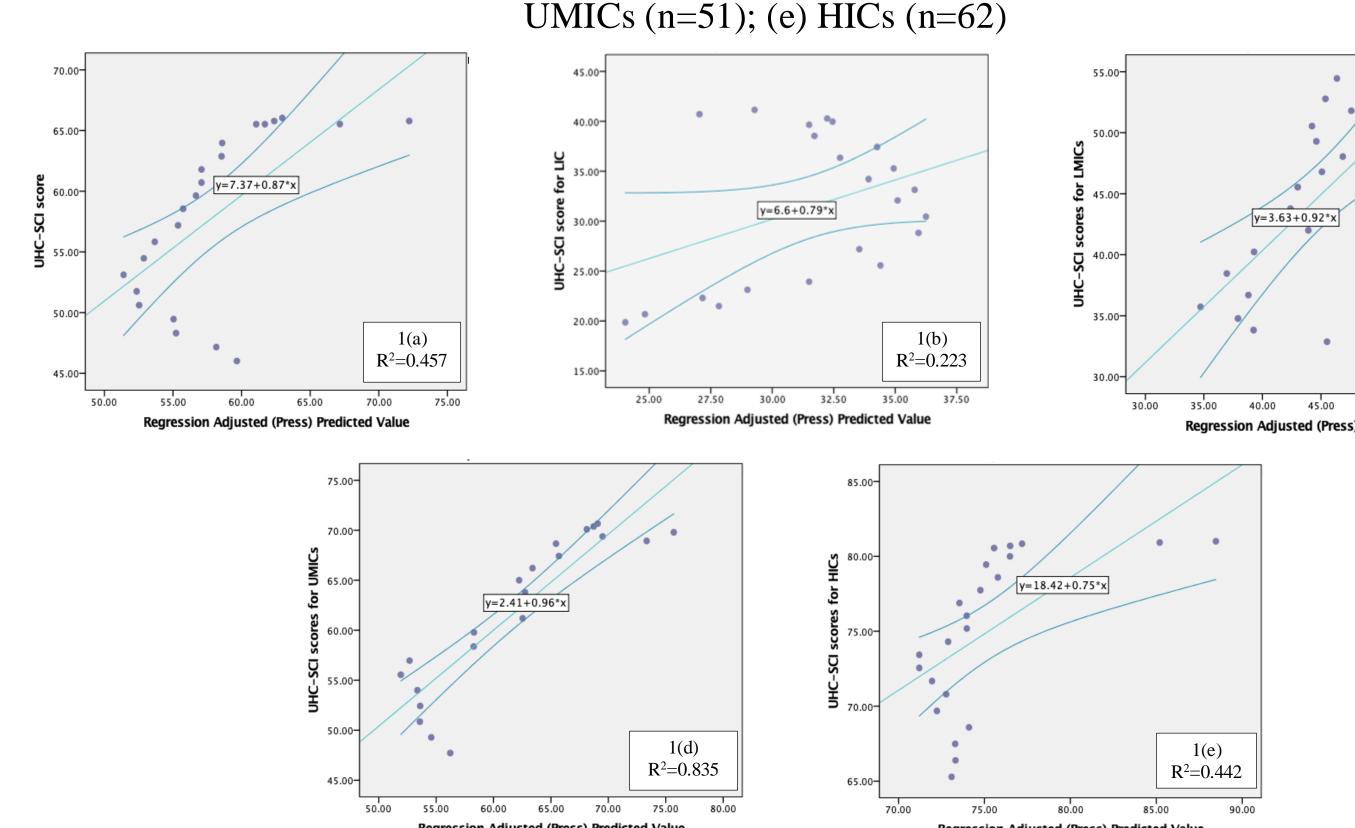

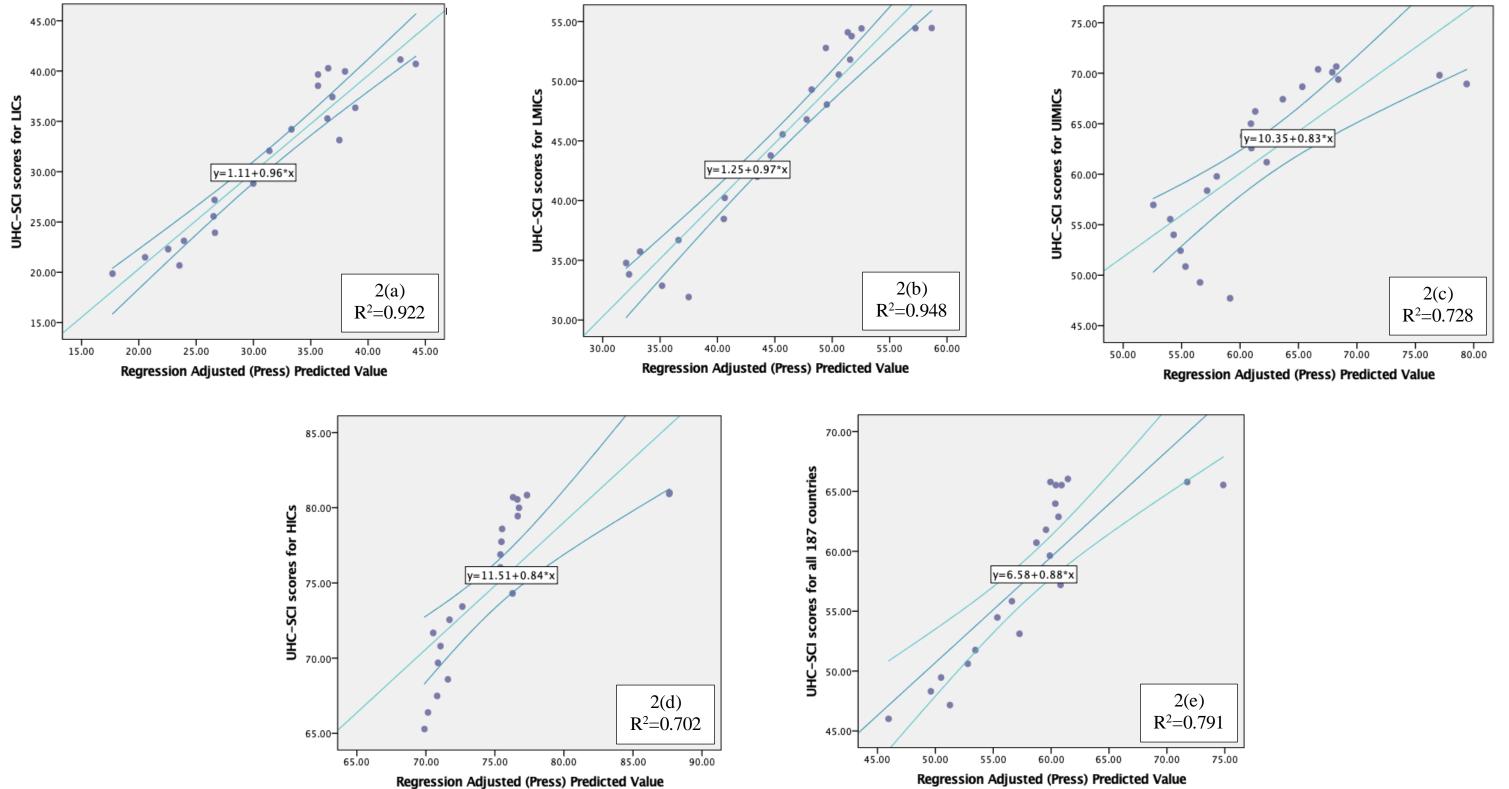

Figure 2: Scatterplot distribution for a multiple linear regression analysis model consisting of PHE-GDP (%) and EXT-CHE (%) to predict the variability in UHC-SCI mean scores in (a) LICs (n=22); (b) LMICs (n=50); (c) UMICs (n=51); (d) HICs (n=62),; (e) all 187 countries

#### **CONCLUSIONS**

- There is a need to advocate for increased public health spending in LICs and LMICs, with optimal allocation of resources and reduced reliance on external sources to focus on sovereign priorities.
- Components of the UHC-SCI may need to be re-evaluated to engineer a shift towards inclusion of secondary and tertiary health services in addition to primary health care to effectively monitor progress in coverage after a certain level of UHC attainment as seen in UMICs and HICs.
- There is a need to ensure implementation of cost-effective policies so that the allocated public health funds are efficiently used for maximum effect.
- Continued research into improving efficiency of health investments, especially in UMICs and HICs is necessary to ensure a sustained improvement in UHC.
